Next Generation of DBMS? 'Relational,' Say Experts

By John Whitmarsh

CW Staff

ANAHEIM, Calif. — What's the shape of the next generation of data base management systems (DBMS)? In a word, relational.

That was the consensus of a four-person panel of data base experts from business and academia at the National Computer Conference here last Monday afternoon.

No commercial relational data base systems are yet available, but their appearance on the market is due "in the next two years," according to Prof. Michael Stonebraker of the University of California at Berkeley.

"We will be deluged with relational systems very soon," Stonebraker said, noting that relational development is nearing the end of the 10-year cycle between conception of the idea and its appearance in the marketplace.

The new generation of data base architectures will emerge from the interaction of three forces, according to Dr. Michael Blasgen of IBM Research in San Jose. Blasgen heads IBM's System R relational data base project.

The forces for change in future data base systems are research ideas, technological advances and user needs. Among Blasgen's predictions for the future:

- The relational model will prevail.
- The full function of distributed

data bases is needed by only a fraction of distributed applications.

- Data base machines — no matter what the configuration — face a difficult price/performance battle.

- Natural language query, specifically unrestricted English and pseudo-natural languages, are doubtful except for limited applications. The cost is too high.

"The closer we get to the end user, the harder the problems get," Blasgen said.

The use of natural languages in data

Tandem the Tops

By E. Drake Lundell Jr.

CW Staff

DELRAN, N.J. — Users of minicomputers and small business systems think Tandem Computers, Inc.'s units are the tops. The same users put systems from General Automation, Inc. on the bottom of their list.

Those are some of the results from the widest ranging survey of user experience with computer systems ever undertaken by Datapro Research Corp. here.

In all, 2,309 users responded to the minicomputer part of the survey,

NCC a Low-Key Show Despite Record Crowds

By the CW Staff

ANAHEIM, Calif. — Hardware on the exhibition floor vied with software in the technical sessions last week as more than 80,000 people poured into Mickey Mouse's hometown for the National Computer Conference.

This year's version of the annual gathering of the DP crowd — and the first with a decidedly international flavor — was low-key in spite of the "record" crowds claimed by the American Federation of Information Processing Societies, Inc., which sponsors the show.

The exhibit hall itself was marked by mainly OEM exhibits and devoted almost exclusively to hardware, while the technical sessions of most interest to DPs revolved around software and data base in particular.

Exhibits Dominant

But, as usual, the group that went to the technical sessions was outnumbered by 4 or 5 to 1 by the number that were either exhibiting or just exhibit guests — although the data base and software sessions drew some of the world's leading authorities.

Users coming to gather information on distributed data processing and the coming integration of voice, data and record communications were amply treated with exhibits on the floor; however, those who were looking for software packages on the floor were probably disappointed as the software vendors were dwarfed by their hardware brethren.

The clack of printers was constant — interrupted slightly in the West Exhibit Hall where a group of birds was trapped by the makeshift enclosure.

International Flavor

For the first time, NCC also came alive as a truly international gathering — almost in spite of the xenophobia

displayed by the major speakers.

While almost all of the major speakers — from the keynoter on down — warned of the problems U.S. industry will face from the coming invasion of Japanese competition, users flocked to the booths of Japanese vendors, lured by the promise of low prices and higher reliability than available here.

And in addition to the Japanese, non-U.S. participation — led by a huge delegation from Scandinavia, South America and Germany — added flavor to both the sessions and exhibit floor.

But in the end Mickey might have won out, since almost as many people visited Disneyland as the other world on the exhibition hall floor. It may be difficult to tell which was more real.

Software Costs Can Be Tamed, Developers Told

By Marcy Rosenberg

CW Staff

ANAHEIM, Calif. — Yes, there are ways to improve the economics of software.

The costs associated with software development — like so many other things that tend to run wild — can be tamed if breeding takes place in a well-ordered environment.

Creating a well-ordered development setting for software gives the developer the power to control not only the one-time costs, but also the recurring costs, according to Fred P. Tatar, manager of software support and operations at Ford Aerospace & Communications Corp.'s Western Development Laboratories division in Palo Alto, Calif.

Tatar shared what he called his "Camelot affair in software development systems" with session attendees at the National Computer Conference here last week. The object of his affections is the Development Support Machine (DSM) concept that was two-and-a-half years in the making at Ford Aerospace.

DSM consists of a Digital Equipment Corp. PDP-11/70 with "programmer's workbench software" running under AT&T's Unix time-sharing operating system.

Also associated with DSM are design support tools such as hierarchical design languages and system simulation programs, plus compilers and other implementation support tools for programmers.

Ford Aerospace uses DSM for software development and personnel training.

Xerox Says Local-Area Ethernet to Feature 98% Transmission Throughput Efficiency

By Phil Hirsch

CW Washington Bureau

ANAHEIM, Calif. — Transmission throughput efficiency of 98% is one key feature of the Ethernet local-area data communications network Xerox Corp. is developing in collaboration with Digital Equipment Corp. and Intel Corp., a Xerox official said here last week at the National Computer Conference.

Growing use of computers and intelligent terminals, combined with a desire among users to escape the limitations of telephone company-provided local loops, has created interest in local-area networks and an expectation among Xerox and several other computer and terminal vendors of a big market in the '80s. The Ethernet technical specifications that the three companies are jointly developing (see story on Page 117) are intended to become industrywide standards.

David Liddle, vice-president for systems development in Xerox's Office Products Division, said at NCC that prices and delivery schedules for the first Ethernet commercial products will be disclosed during the fourth quarter of this year. One of these products will be the already announced 860 word processing system. Liddle declined to talk about the other one.

Ethernet is a passive, coaxial cable-based transmission bus to which a wide variety of smart and dumb terminals can be attached via transceivers. The system also accommodates digitized voice transmission. It was designed for a single building complex — such as an office or industrial park — containing large numbers of on-line terminal devices.

Using baseband digital transmission, the Ethernet cable can carry up to 10M

bit/sec. Through one or more "gateways," the network connects its users to long-distance telephone circuits and

CW at NCC

other outside networks.

Possibly the most appealing feature of Ethernet, aside from a high bit rate, is its elimination of the cost and complexity of conventional switching. Instead, each terminal contends for a place on the cable. But through use of a patented "collision recovery" system embedded in the transceiver, the effects of interference are largely eliminated.

Each transmitted bit must travel to the receiving station and back again within a given time interval. If this does not happen, it is assumed that a collision with another message has occurred and the bit is retransmitted.

A random delay is programmed into each terminal's transmission control system to prevent the same thing from happening again. According to Liddle, this scheme is the main reason for Ethernet's high throughput.

Bits are packetized before being transmitted, and each packet contains a 48-bit address field that is large enough to give every receiver a unique identification. The transceiver is programmed to accept only those messages containing specified address codes and to ignore all others.

The formatting of the packets is performed by a very large-scale integrated (VLSI) microprocessor-on-a-chip that typically is part of the terminal device interfaced to the cable. Since the chip is completely self-contained, it does not have to borrow memory or pro-

cessing capability from any intelligent terminal to which it may be connected.

Relation to X.25

The specifications to be developed by Xerox, Intel and DEC are expected to be published in the third quarter of this year. They will define the electrical connections and link-level communications protocol to be used on Ethernet.

These are similar to the first three levels of X.25, the international packet network protocol. Liddle emphasized, however, that the Ethernet protocol is related only structurally to X.25. Operationally, they are totally different because X.25 was designed for polled networks while Ethernet utilizes contention to allocate transmission capacity.

Furthermore, the protocol being developed jointly by the three companies will not extend beyond the link level. Each partner, however, may — on its own — add higher levels to the basic Ethernet protocol, analogous to the higher levels now being negotiated internationally for packet networks.

"Xerox is providing the basic design represented in the Ethernet network capability," the partners said in a jointly issued press release. "Digital Equipment Corp. is providing system design expertise in the area of communications transceivers and micro-, mini- and mainframe computer networks. Intel is providing expertise in the partitioning of complex communications functions into microcomputer systems and VLSI components."

The press release added that use of the specification by other corporations and organizations will be encouraged.

Xerox will also license its Ethernet patents to interested manufacturers.

The Big Difference between other software companies...

(including IBM)

and
ADR

When you buy software products from IBM and other software companies, you get a single solution to a single problem. When you install software from ADR, you get a component of an integrated network of systems software products.

ADR's integrated network is the intelligent grouping of software products so that the features of each reinforce the value of the others without effort or overhead by the user. This new dimension in software not only enables users of ADR products to solve today's problems, but to build a solid foundation for addressing the problems of tomorrow.

For a presentation or information about the big difference between ADR and other software companies, including IBM, call or write today. Applied Data Research, Route 206 and Orchard Rd., CN-8, Princeton, NJ 08540, Telephone (201) 874-9100.

ADR's Integrated Network of Systems Software Products

Harris Supports 3270 Users Protocol-Changing Controller Leads Debuts

By Brad Schultz
CW Staff

ANAHEIM, Calif. — Users can change their IBM communications protocols with a controller series unveiled by Harris Corp. at last week's National Communications Conference here.

One of the major communications-oriented product announcements at NCC '80, the Harris 9210 and 9220 controllers, are compatible with IBM's 3270 terminal family and handle both local and remote traffic in IBM's Systems Network Architecture/Synchronous Data Link Control (SNA/SDLC) or binary synchronous networks.

The 9200 controllers can attach locally to IBM host systems in 3272 or SNA modes at channel speeds, a spokesman said. Remote links to the host run at speeds up to 9,600 bit/sec.

In an SNA/SDLC environment, the 9200s handle half-duplex, flip-flop and send/receive communications, the spokesman said. Under the binary synchronous protocol, the controllers handle Ascii and Ebcid formats over full- or half-duplex facilities.

The 9220 controller has all the 9210's capabilities plus support for concurrent communications with more than one host computer system. A user with hosts in two distant cities operating under SNA or binary synchronous protocol can run communications with each host through the 9220 at the same time, the spokesman explained.

The 9200s allow users to shift from SNA to binary synchronous, or vice versa, with "minimum effort," he claimed.

Harris is also offering a number of peripheral devices for the 9200 series. The Model 9278 CRT terminal has three display intensity levels and screen sizes in the 960- to 3,440-character range; keyboards come in data entry, typewriter and keypunch styles.

Printers for the 9200 controllers in-

clude both dot matrix, bidirectional models with print speeds of 80-, 130- and 180 char./sec and band printers that deliver 240- or 300 line/min, according to Harris.

A "basic" 9200 system including the

CW at NCC

processor, six CRT terminals and a single 130 char./sec bidirectional printer costs \$23,306. It can be leased for three years at \$665/mo. Harris' Data Communications Division is at 16001 Dallas Parkway, Dallas, Texas 75240.

Network Management

In other communications news at NCC '80, Four-Phase Systems, Inc. introduced a network management system called IV/10 and showed OMS/IV, its already announced office management system "for the distributed processing environment" [CW, May 19].

Within a cluster of Four-Phase computer systems, the IV/10 controls operations such as application updates, program compiles and line traces. Tasks can be initiated centrally for any number of remote facilities, the vendor maintained.

The network management system was also said to provide a remote terminal subsystem for "an application-transparent interface to multifunction and stand-alone software systems operating on Four-Phase processors." The IV/10 employs the SDLC protocol.

Intended to support concurrent on-line and batch data communications as well as local computing, word processing, electronic mail and "executive services," the OMS/IV emulates IBM's binary synchronous 2780, 3780, 3270 and Hasp protocols. The office management system also handles the 3770

and 3270 protocols under SDLC.

An extended version of the IV/10, requiring 480K bytes of memory, costs \$17,500. It can be leased for \$325/mo. A basic IV/10 costs \$15,020 and leases for one year at \$315/mo.

The vendor's address is 10700 N. DeAnza Blvd., Cupertino, Calif. 95014.

Speech Recognition

Another NCC debut was that of Heuristics, Inc.'s Model 7000 speech recognition unit for terminals with the RS-232C communications interface. "The 7000 will enable technicians, business executives and others who don't type, or whose hands or eyes are busy with other tasks, to enter information onto their computers directly with virtually no errors," a spokesman claimed.

The unit can be trained to recognize up to 64 words or phrases, each up to 3 sec in duration of pronunciation. The 7000 is reportedly compatible with Cobol, Fortran, Basic and Pascal. It costs \$3,000.

Heuristics is at 1285 Hammerwood Ave., Sunnyvale, Calif. 94086.

A dumb terminal was announced by Lear Siegler, Inc. at NCC '80. The

Model ADM-3A-Plus is reportedly similar in design to the vendor's ADM-3A, but offers faster data entry.

Among the extended features are separate cursor control for single stroke up, down, left and right; a key that locks the terminal into upper case mode; and full upper and lower case character sets with two dot descenders. The 1,920-char. dumb terminal runs asynchronously in half- or full-duplex modes in the 75- to 19.2K bit/sec range. It costs \$945. Lear Siegler is based at 714 N. Brookhurst St., Anaheim, Calif. 92803.

Finally, Computer Devices, Inc. released a Programmed Applications Terminal (PAT) for end users. The Model 1206/PAT executes Basic source programs that are automatically called and loaded via minicassette or other media when the computer is switched on.

The terminal features a 64K-byte processor and comes with an 80-column, 50 char./sec thermal printer, integral minicassette drive, built-in modem and acoustic coupler. The entire unit weighs only 17 lbs. and costs \$5,195.

Computer Devices is at 25 North Ave., Burlington, Mass. 01803.

Next DBMS? 'Relational'

(Continued from Page 1)

base systems was given a thumbs-down by the panel. "Natural languages are notoriously nontransportable," commented Dennis McLeod of the University of Southern California at Los Angeles.

"Natural languages do not work well now and won't work much better in the near future," Stonebraker added. Nevertheless, he predicted the appearance of natural language front ends that will make "neat sales tools for the vendors and will come into the market in the next few years. Despite the vendors' feelings that these front ends will impress the socks off the end user as sales tools, we should not underestimate them."

The chief problem with natural and pseudonatural languages, IBM's Blasgen explained, is that "it is impossible to predict whether the system will accept the sentence because of the complexity of the grammar."

Chief Features

What are the chief features of the next DBMS generation? For starters, they will be more graphically oriented, Beatrice Yormak of Interactive Systems Corp. believes.

"One reason for this is that the typical user of a DBMS will change," she said. "DBMS will be heavily used in office-of-the-future applications by users who can be assumed to have no knowledge of data base technology."

"This means that current DBMS architectures — which not only assume a well-defined relationship between entities, but also make the tacit assumption that the user has a prior knowledge of these relationships — will be less useful in the next generations," she observed.

Yormak envisioned a second major trend in computing. That will be "to

incorporate more of the enterprise's information into data bases. The new technologies of video and laser disk will be more prevalent, making it inexpensive and convenient to store vast amounts of data."

"It will become routine to use these technologies for the storage of information that is now handled manually."

This development carries a price, however. "What this implies is a DBMS that is more 'navigational' in nature — one that allows the user to query almost randomly and one that does not require a vast amount of knowledge of logical structure," she noted. Systems like Spatial DBMS will emerge as "the typical DBMS."

A third requirement of the next generation of DBMS will be to incorporate semantic information into the data.

"This means that procedures for controlling semantic integrity will need to be handled by the DBMS," Yormak explained. "As data being stored becomes more qualitative in nature, semantics will play a very important role. A need will arise for the DBMS to provide a mechanism for the 'naive' user to define semantics and to query and retrieve via semantic content."

The implication, Yormak said, is that data models, as now known and loved, will be less important to the DBMS end user.

The difficulty of data base design was reaffirmed by Stonebraker, who agreed with IBM's Blasgen that the most difficult years are still ahead.

The problems are especially acute in distributed data base design. Many academic and industry prototypes exist, but "nobody knows how to deal with concurrency control and crash control, and nobody knows how to design a data base for one machine, let alone multiple machines."

OBS WYLBUR® = INCREASED PRODUCTIVITY

FOUR PACKAGES IN ONE TO DECREASE DEVELOPMENT AND TEST TURNAROUND TIME.

- On-line program development
- On-line production job scheduling
- Document formatting
- Interactive word processing

PRICED 30-50% BELOW COMPETITIVE SYSTEMS, WYLBUR® HELPS YOU ATTRACT AND KEEP THE BEST PROGRAMMING TALENT. CONSIDER THESE FEATURES:

- Fast and flexible full screen cursor editing
- Job submit, control and output retrieval
- Dataset maintenance
- Interactive command language
- One- to three-second response time

STILL WAITING FOR REPORTS?

If you're still waiting, you haven't tried EASYTRIEVE, the software system that supplies information in the simplest manner and in the least possible time to users of IBM and Siemens hardware.

By use of a free-form language there are no coding forms, and no need to be a programming specialist to obtain the information you want.

In a matter of moments, a program can be written in English and run to provide exactly the report information you require. EASYTRIEVE does the formatting, the figuring, the selection of just the data you need. Automatically. Quickly.

Anyone who needs information can learn to use EASYTRIEVE. From a non-DP oriented secretary to a plant manager to the executive VP of a division. Yet, EASYTRIEVE is powerful enough to do: systems housekeeping, computer graphics, create test data, job accounting and even budget forecasting.

EASYTRIEVE interfaces with IMS, DL1, IDMS and TOTAL to dramatically reduce the technical complications involved in accessing data from the data base. And, it can be used with all major interactive/on-line systems.

With EASYTRIEVE. You'll never have to wait again. From Pansophic, the people who bring quality systems software to a worldwide user base. Call us toll-free for more information.

For DP, Electronic Mail, Office Uses Zilog Offers Local, Packet-Switched Net Design

By Brad Schultz
CW Staff

ANAHEIM, Calif. — A local data network architecture for commercial users was introduced by Zilog, Inc. at the National Computer Conference here last week.

The Z-Net packet-switched architecture supports DP, electronic mail and office automation applications, a Zilog spokesman said. Small businesses can use the local net for Cobol-based, multiterminal tasks such as inventory control and order entry.

Z-Net's design calls for distributed control points linked by the coaxial lines used in cable TV. Zilog's MCZ-2 microcomputers and a cartridge disk subsystem — the Shared Data Station (SDS) 2/01 — can serve as Z-Net nodes, which are joined to the coaxial lines by a wall-mounted transceiver.

Each SDS 2/01 holds a common data base for the various MCZ-2 microcomputers in the network. The disk subsystem's storage space can be increased in 10M-byte increments from a 10M-byte minimum to a 40M-byte maximum capacity, the spokesman said.

Single-Channel Architecture

The main idea behind the Z-Net design is distributing a system's low-cost elements such as CPU, memory and terminal while sharing such high-cost elements as peripherals and data bases.

With the single-channel architecture, computing power expands as more nodes join the network. That is because the processor at each node — an MCZ-2 or the 64K-byte Z-80A within an SDS 2/01 — is dedicated to a single user, the spokesman explained.

"For the same reason, a processor failure at any one station has no effect on the rest of the system," he said, "unlike time-shared computer systems."

The SDS 2/01 contains a hierarchical, multiuser file manager with

record-level locking and unlocking and support for the subsystem's full 40M-byte range of storage. This software is packaged with the rest of the subsystem in a 30-in. rack for the of-

CW at NCC

fice environment.

Up to 255 stations, in any combination of MCZ-2s or SDS 2/01s, can be supported by Z-Net. The stations may be deployed at desks, office spaces and auxiliary rooms in a number of buildings along a total coaxial cable length of two kilometers.

Unified Net

According to the Zilog spokesman, Z-Net gives the commercial user an opportunity to build a unified network of diverse computing devices. The MCZ-2 microcomputer can serve as a universal controller for peripherals in

firms converting to decentralized DP and electronic mail applications.

Under Zilog's RIO/CP operating system and network protocol software, the MCZ-2 can break applications into modular subtasks that are executed concurrently. And these modules can communicate with each other, regardless of whether they are resident on the same CPU or on different CPUs in the network.

"This is the real power of the Z-Net architecture," the spokesman asserted. "It makes communication between tasks across the network completely transparent to the application."

The application program discerns no difference between a user interacting with local floppy-disk storage or with the network's shared storage, he explained. Similarly, a control program servicing I/O devices under Z-Net reportedly can pass status information or data to a task running anywhere in the network as if that task resided at the same station.

Thus, Zilog claims that multiple-task programs developed on one MCZ-2 micro can run on any other computer or combination of computers in the local network without modification.

"Dependence on system configuration is [therefore] taken out of applications software," the spokesman maintained.

The SDS 2/01 half-removable, half-fixed-disk subsystem costs \$13,750. The 2/01 network station transceiver, required to join an SDS 2/01 or MCZ-2 to coaxial lines, costs \$950. And the third main component of Z-Net, a network protocol software package, has a license fee of \$200 per system.

Although best known as a manufacturer of microprocessors, Zilog began marketing desktop computers last year and has entered the data communications marketplace with the Z-Net announcement. The Exxon Enterprises, Inc. affiliate is headquartered at 10340 Bubb Road, Cupertino, Calif. 95014.

PE Beefs Up Megamini Software

By Marcy Rosenberg

CW Staff

ANAHEIM, Calif. — Action in the 32-bit superminicomputer arena is heating up.

At the National Computer Conference here last week, Perkin-Elmer Corp. (PE) brought out an enhanced version of its year-old Reliance I integrated transaction processor and introduced an associated interactive query system, both for its 32-bit Megamini processors.

The firm is also providing new versions of its 32-bit Ansi Cobol-74 and RPG-II compilers.

With these software announcements, PE becomes the third major manufacturer to bring new offerings to the commercial 32-bit superminicomputer

market in the last month.

Data General Corp. entered the market with its first 32-bit processor, the Eclipse MV5-8000, and associated software at the end of April [CW, May 5], and Digital Equipment Corp. followed close behind with a host of VAX-11/780 software enhancements [CW, May 12].

Runs on 3220s, 3240s

Called Reliance II, PE's enhanced transaction processing system runs on the 3220 and 3240 processors. Among its features are an improved access security system, capability for message switching between terminals, a facility for background processing of low-priority transactions, an automatic restart option and Integrated Transaction

Controller (ITC) support for its Model 1250 dial-up, 9,600 bit/sec terminals.

Geared for distributed processing environments, the expanded security capability includes user IDs and passwords, plus passwords for each screen-form transaction type, which are categorized into groups by application and personnel job level. As a result, the system can authorize terminal access by password group, according to Kenneth I. Cohen, line-of-business manager for commercial software.

Another difference from Reliance I, which allowed only one control terminal, is that under Reliance II any terminal in a network authorized by the security system can function as the controller. Reliance II also offers user-to-user mail capability allowing any terminal, controller or otherwise, to send messages to any other.

The updated transaction processor also allows multiple Reliance environments to operate concurrently on the system.

For ease of operation, an interactive query system, not previously available to Reliance I users, runs under Reliance II as a set of vendor-supplied transactions.

Priced separately, IQ/32 is said to allow screen-form fill-in-the-blanks definition of retrieval criteria. Fields to be presented are selected separately and output can be viewed either on a CRT terminal or printer, the vendor stated.

Updated Cobol and RPG-II compilers boost performance — measured in time to execute generated code — by between 30% and 50% and between 5% and 15%, respectively, Cohen claimed.

Available now, an initial license for Reliance II costs \$12,500. IQ/32 licenses for \$3,000; Cobol, for \$5,000; and RPG-II for \$2,500.

A typical configuration including all software, a 70-terminal system, 1G bytes of disk storage, two tape drives and bisynchronous communications to an IBM 370-type host costs \$400,000.

All products are available from PE's Computer Systems Division at 2 Crescent Place, Oceanport, N.J. 07757.

QWIKTERM

Honesty, Pay, Challenge Cited as DPs' Needs

By Marguerite Zientara
CW Staff

ANAHEIM, Calif. — The keys to "How to Recruit, Develop and Retain Top DP Talent" lie in management honesty, fair compensation based on performance and the availability of new challenges to high performers.

Addressing a crowd of about 300 at the National Computer Conference here recently, Donald P. Owens, manager of DP sales and marketing for the Fox-Morris executive search firm in Philadelphia, cited an 18% growth in the demand for DP professionals from 1979 to 1980.

"The rapid growth of the industry, as well as the critical housing market that has stymied relocations, has resulted in a shortage of technical people to fill many vacant jobs," Owens noted. In the face of such difficulties, Owens suggested a DP manager who needs technical personnel will find that employees already within the company are often his best source of talent.

"You already know these people, and a transfer to a better position within the company is always a moral booster for employees," he emphasized, noting that this valuable resource is "often ignored."

Outside Sources

Other potential sources of personnel are business associates, professional and trade associations, alumni placement services and "Forty-Plus" clubs, many of whose members have "very, very impressive credentials," Owens said.

Customers and competitors also offer talent sources, "although the best approach in such situations may be through a third-party recruiter to avoid conflicts or hurt feelings."

In addition, industry and trade publications lend high visibility to DP talent. "Look for names, achievements, awards and quotations and keep notes on them for future reference," he said.

In recruiting personnel, a manager must decide whether he will do the recruiting himself or look to a third-party recruitment or search firm. "While doing one's own recruiting is less expensive and the manager knows best what he wants, it is also extremely time-consuming, and the firm gives up the confidentiality offered by a third-party recruiter."

"The most effective efforts result from a combination of an in-house recruitment effort and the use of an effective, respected third-party employment agency or executive search firm," he claimed.

Preparing for Interviews

Once recruitment efforts begin bringing in responses, the challenge is to identify potentially outstanding, high-performance DP employees. "The single most important element in such an evaluation is past performance: what the candidate has accomplished so far," Owens emphasized.

In addition, "companies often forget they, too, are being interviewed by hard-to-find talent," he noted, adding, "The first impression an applicant receives of a firm can send a candidate on his way if it is negative."

A manager should prepare for each interview beforehand, Owens counseled. "Know the job content and specifications, know the applicant's

background, establish interview objectives and structure the interview instead of letting the applicant structure it."

Owens also suggested that recruiting managers:

- See that the receptionist knows the candidate's name and is expecting that person.
- Don't ask the applicant to fill out an employment form at the time of the interview, but rather before or after.
- Don't make the applicant wait more than 15 minutes for the interview. If the recruiter is late, he should apologize "just as you would expect the candidate to apologize if he were late."
- Never conduct extensive interviews by telephone.

• Have a potential executive interviewed by an executive, not the assistant director of personnel.

CW at NCC

• Don't resent the candidate who has done research on the company and asks pointed questions.

• Be honest and forthright about job content, responsibilities and chances for advancement, since "false expectations are a cause of fast turnover."

Developing Potential

As for developing the potential of DP employees, "there must be a marriage between a human resources develop-

ment plan and DP management," asserted Jim Stallard of the Computer Services Division at General Dynamics Corp. in St. Louis.

"If management identifies the skills necessary for each position and tells employees what training is necessary to fill the requirements, then the employees themselves will be driving the plan by asking how they can get to the next step."

"Make it clear that some positions are based on competency and some are based on competency and vacancy," Stallard warned. "Don't raise expectations unrealistically."

High performers need many challenges. "You have to change and vary assignments often in order for high performers to learn," he added.

Will you find the need to protect your tape data sets?

By accident?

It's an accident you can't afford. Protect your data sets with TLMS II. The standard in Tape Library Management Systems, TLMS II gives you complete control over your tape libraries. And, TLMS II provides off-site storage and movement facilities to support your disaster planning efforts.

TLMS was the only tape library management system chosen for the 1979 Datapro Honor Roll Award—it's your best choice in tape management. Call us at 602-264-7241. We'll show you how TLMS II can help you minimize accidents. Capex is a diversified soft-

ware company involved in the development and marketing of programmer productivity, system management and operations software. Capex products are marketed through sales and service centers in major U.S. cities, by Capex subsidiaries throughout Europe, and by international sales representatives worldwide.

Capex is conducting information seminars on Disaster Planning nationally throughout 1980. If you wish to participate as a speaker or as an attendee, contact C.R. Boyd—National Coordinator for Disaster Planning Seminars.

Mini Users Rate Tandem at Top, GA at Bottom

(Continued from Page 1)

sending "excellent," Tandem users gave their systems a 3.8 overall satisfaction rating to top the list and to lead among the three primarily distributed data processing (DDP) suppliers in the survey. GA systems received only a 2.3 from their users.

In the category of traditional minicomputer manufacturers, Texas Instruments, Inc. led the ranking with a 3.5 overall satisfaction level.

The survey found that mini users which buy their systems from the traditional mini makers are happier with their systems than those who buy minis from mainframe vendors. Users that purchased systems from mainframe vendors generally rated their systems at 3 or under while those that purchased systems directly from mini makers rated their systems higher.

Furthermore, users of small business computers are generally happy — all gave their systems a better-than-3 rating. DDP users also rated their systems above 3 in general.

Here's an area-by-area rundown of how the users rated their vendors. Only those systems rated by at least 10 users are included:

• **Traditional Mini Makers:** TI led this group of eight firms with GA at the bottom, perhaps because of the problems that firm has been encountering on a corporate level for the past few years.

TI users expressed an overall satisfaction level of 3.5 and 98% said they would recommend their systems to other users. The 17 that plan to buy new equipment this year will get it from TI.

Following TI in this category is Hewlett-Packard Co., whose users gave their equipment a 3.4 rating on the scale; 87% of the HP users indicated they would recommend their equipment to others.

Next in line is Prime Computer, Inc. with an overall rating of 3.3 and 95.3% of the users willing to recommend the systems.

Datapro's Biggest Survey

Datapro Research Corp.'s 1980 "Annual Survey of User Opinion of Computer Systems" represents the largest survey of its type ever undertaken in the U.S. It summarizes the experiences of 4,614 users of mainframes, minicomputers and desktop computer systems.

In all, 14,990 users were contacted by mail for the survey; their names were drawn from selected portions of the *Computerworld* subscriber list. Each was contacted twice.

Responses came from 5,337 users. After careful analysis, 4,614 responses were judged valid, resulting in a 31% valid response rate.

In the area of mainframes, 2,006 users rated a total of 3,885 systems of 75 model types from 12 vendor

categories [CW, May 19].

In the area of small systems, presented here this week, 2,309 users rated 3,457 minicomputer systems of 116 model types in 32 vendor categories (including "other") and 299 users rated 549 desktop and microcomputer systems in 23 models in 18 vendor categories.

Each surveyed user answered 87 questions in 14 different categories about the equipment it had installed — leading to a wealth of information on how users use systems and what they think about them.

Full survey results and an analysis by Datapro researchers is available for \$25. Datapro's address is 1805 Underwood Blvd., Delran, N.J. 08075.

Digital Equipment Corp. is tied for the next spot with Perkin-Elmer Corp.; both got ratings of 3.1 from their users. Eighty-four percent of Perkin-Elmer's users would recommend their systems and 82% of the DEC customers would do likewise.

Data General Corp. was next in line with a 3.0 rating and only 73% of its users willing to recommend the systems. Dropping below the 3.0 level of satisfaction were Modular Computer Systems, Inc. with a 2.7 overall satisfaction rating and 69% of its users willing to recommend their systems, then GA with its 2.3 rating. Only 40% of the GA users would recommend their systems to others.

• **Mainframe Manufacturers:** As a group, the mainframe manufacturers that also market minicomputers did not fare as well in their users' eyes as did the other groups.

However, IBM, which was a distant sixth in user opinions about mainframes [CW, May 19], tops the list in this group with its mini systems, receiving a 3.1 in overall user satisfac-

tion. But while it is tops here, only 72% of its users would recommend their systems to others.

IBM is followed by NCR Corp. whose users rated its mini systems at 3.0, although 42% of the NCR users would not recommend their systems to others. Next in line is Honeywell, Inc. with a 2.9 rating and with 73% of its users willing to recommend their systems.

Following Honeywell was Univac

with a 2.6 rating, even though 54% of its users would not recommend the systems, and Burroughs Corp. with a 2.5 rating, 54% of whose users would recommend their equipment.

• **DDP Vendors:** Besides giving Tandem the highest rating in the survey of those with 10 or more users responding, 100% of the Tandem users said they would recommend their systems to other users, also topping the list.

Wang Laboratories, Inc. follows in this category. Its users gave Wang systems a 3.3 overall satisfaction level and 87% said they would urge others to get similar equipment.

Next is Datapoint Corp. with a 3.1 rating; 84% reported they would recommend the equipment. Four-Phase Systems, Inc. got a 2.9 rating and 82% of its users would recommend that equipment.

• **Small Business Computers:** The makers of small business systems all received ratings above 3. They were led by Qantel Corp. and Microdata Corp., each of which received a 3.4 rating.

Eighty-four percent of the Microdata users and 80% of the Qantel users would recommend their systems to other users.

The other firm in this group — Basic Four Corp. — came in at a respectable 3.2.

Costs of Software Tamed

(Continued from Page 1)

Before DSM was born, the company had no complaints about its software development procedures, had libraries of programs and felt it was keeping up with the state of the art, Tatar recalled. In fact, Ford's software business escalated to millions of dollars per year, and software now accounts for between 80% and 90% of the systems the firm develops.

There were problems, however. "We

were hurting for a platform," Tatar commented, referring to the software development group. "We were in contention with the hardware group for machines to use for development."

Not only has DSM given software development engineers the machines they need, but it also provides them with tools that are standard. By creating a standard way of doing things, Tatar's division is less dependent on specific individuals' expertise.

And because DSM provides machines and other resources to allow parallel development by as many as 48 programmers, it has significantly minimized the problem of contention for resources.

The fact that DSM has created a well-organized working environment supported by the proper tools has also served to boost morale "significantly," Tatar maintained.

But how do these benefits realized through DSM translate into savings of software development costs?

Since implementing DSM, Tatar claims a 15% increase in the company's hit ratio for attracting new employees and a 30% drop in turnover. He attributes this directly to DSM because he maintains the working environment it creates is attractive.

Pre-DSM productivity in Tatar's group measured out to an average of from one-half to one line of code per hour, where lines of code include everything from JCL to commentary. To give an idea of how productivity affects software development costs, Tatar said that an average productivity rate of eight lines of code per day costs about \$1 million per year.

DSM boosted productivity about 25%, while increasing employee skill level by 100%, Tatar contended.

Poll at Convention Center Shows Minis, DDP, Software Draw Users to NCC

By Nancy French

CW Staff

ANAHEIM, Calif. — Interest in minicomputers, distributed data processing (DDP) and packaged software were what drew most users to the National Computer Conference here last week, according to an informal poll taken at the convention center.

There is nowhere else but NCC that one can look at all the new equipment and get a feeling for what's really happening, said Ben Mossberg, a systems analyst for the Department of Civil Engineering at the University of Southern California (USC).

Benjamin S. Aitken, DP manager for Stanley Drapery Hardware of Wallingford, Conn., agreed. He added that the great plus offered by NCC is the opportunity to "talk to all the salespeople and get a large number of facts without pressure to buy."

USC's Mossberg came to the show to see "the new 32-bit minicomputers." USC, which has many makes and models of computers installed, is always interested in "how to get more for less," Mossberg said. The show provided a good way to see new disk storage equipment, terminals and plotters, he added.

Robert Jackovich, director of corporate planning for Nortron Corp. in Sunnyvale, Calif., was looking last week for a system to replace his small Qantel 1400 system. At the moment, he does not know what he wants, but is leaning toward a medium-size mainframe rather than a mini — "something that will hold the company for a few years without the need for an upgrade," — because Nortron, which manufactures computerized wheel-balancing and wheel-alignment equipment for automobiles, is in a "tremendous growth mode."

Searching for Software

Patrick Schiemenz is a systems analyst and programmer with the U.S. Food and Drug Administration (FDA) in Rockville, Md., where an IBM 4341 was recently installed. He was here last week to look for "software we can put on it."

The 4341, installed to replace a 370/168, is being used for data base applications. Right now, the FDA is working on adapting its Computer Corp. of America Model 204 data base management system to run on it.

Distributed computing equipment and fund accounting software packages brought Dr. Roland Spaniol to NCC last week. Spaniol, who is director of Computer Services for Eastern Illinois University, wants to purchase all software and purchase it installed, because the university cannot afford to hire people to write it.

For Rudy Muravez, finance director for the city of San Luis Obispo, NCC provided an opportunity to see "peripherals that make our systems more useful."

For Charles Miles, a mechanical engineer at the U.S. Navy's Civil Engineering Labs in Port Hueneme, Calif., NCC was the place to see what new things are around. Last week he was looking at remote job entry equipment, disks and graphics terminals.

Minicomputers were the drawing card for Dennis Murphy, assistant

controller for Marsteller, Inc., a Chicago-based advertising agency with offices all over the world. That firm now uses a 370/115 in Chicago to run media production and accounting applications and wants to distribute power to locations where there are only terminals at the moment.

Murphy's goal is to replace his key-punch data entry machines with small systems and he spent some time last week looking at Wang Laboratories, Inc. and Northern Telecom Systems Corp. DDP equipment.

Jack Cordaro, manager of systems development for Boeing Computer Services, Inc. in Wichita, Kan., came "to see what I could learn." He, too, is

interested in network architecture for distributed systems and wanted to "find out what other people are doing."

CW at NCC

Boeing is a large IBM user with two 3033s and a 370/168.

R.M. Gleisner, DP manager for Search Unlimited, a recruiting firm for professionals, came to NCC to see new terminals, packaged software and data communications equipment. With a five-person staff, packaged software makes more sense even though it takes more memory, he said.

Anthony Bucholtz, a programmer at Liverpool Hospital in Sydney, Australia, came for the technical sessions in medical imaging. He also spent some time looking at microprocessors for use in data acquisition.

Margaret Griffin, a programmer for Insurance Co. of North America in Los Angeles, came because she "likes to keep up on things" — and was interested primarily in the technical sessions.

Joanne Strauss, senior programmer/analyst for Northrop Corp. of Hawthorne, Calif., came to attend several specific sessions, particularly those dealing with management — a direction in which she sees herself heading.

PROVEN RECORD OF RELIABILITY

FDR™

FAST DUMP RESTORE

FAST DUMP RESTORE

FDR with over 3400 users and nominated to the DATAPRO HONOR ROLL for the 6th consecutive year, has a proven record of RELIABILITY and EFFICIENCY. FDR permits the user more opportunity to back up his files while using significantly less CPU and elapsed time.

COMPAKTOR

A disk management utility which reorganizes disks at FDR speed. COMPAKTOR permits the user to easily position and sequence data sets. Multi-extent data sets are changed to single-extent data sets and the user is also allowed to change both the size and location of a volume's VTOC.

Software Methods Offered To Close User-Designer Gap

By John Whitmarsh

CW Staff

ANAHEIM, Calif. — "Hybridized" software methodologies that rely on greater user involvement may be the next step in closing the distance between the kind of system an end user specifies and what the software engineer designs.

That is the thinking of Lawrence J. Peters, senior staff consultant with Yourdon, Inc., who addressed a packed session on user requirements and software specifications at the National Computer Conference here.

The dichotomy between requirements definition and system design has been a continuing problem in software development. Approaches taken to solve it have ranged from increased formalism in requirements definition to iterative derivation of requirements through prototype development and review, he said.

Heart of Problem

While the various approaches have their commonalities and differences, none strike at the heart of the problem.

"The real issue of requirements vs. design is to define the problem before defining the model of the solution," Peters told the audience.

While the two steps in the software life cycle may be separate processes, "there is a parallel between defining requirements and designing software" that may allow more feedback and participation by user and designer in both stages, Peters said.

Modeling is a communications aid which, because it deals in abstract concepts without minute details, can open the channels of discussion between user and designer, Peters suggested.

Modeling also serves to reduce the odds of a collision between user realities and engineer realities. For example, the user may be concerned with customer satisfaction while the engineer worries about programming languages. The user may look only at the overhead of the system, while the engineer concentrates on its cost. The function of the model, Peters said, is to bring the two camps together.

User in Driver's Seat

Hybridized life cycles are "meant to increase user participation — to put the user in the driver's seat as development progresses," Peters said.

Because hybridized methodologies put the customer and the contractor on the same team, they have distinct advantages over the "classic" software life cycle. In the classic cycle, specifications of the end users were set down and signed off before design began.

"But this meant that all the user saw was documents until very late in the game," Peters explained. "He may have read about his new system but, as with buying a new car, he had not 'driven' it."

Hybridized life cycles not only increase user participation and put user and designer on the same team, but they also have a third advantage.

"They're psychologically advantageous. By involving the user wherever possible, this helps make it 'his' system instead of 'my' system."

Hybrid methodology draws heavily on elements of existing techniques and

methods plus "customized" features. A key ingredient is the incorporation of design methods into the analysis/-

CW at NCC

specification phase.

Because hybridized life cycles depend heavily on prototyping and the re-specification and redesign of the system with the user, they have two advantages over the classic life cycle. First, Peters said, "feedback from the customer comes very early in the hybrid methodologies and second, prototype development also appears very early."

Do Bad Specs Hike Costs?

ANAHEIM, Calif. — Do faulty original specifications of a system contribute to higher software maintenance charges?

Probably not, according to E. Burton Swanson, assistant professor at the University of California at Los Angeles graduate school of management.

Swanson presented the results of his just-completed three-year study of applications software maintenance to a user requirements and software specifications seminar at the National Computer Conference.

Swanson surveyed 2,000 DP managers. From 487 respondents here's what he found:

- Maintenance consumes 49% of the total software applications ef-

fort among respondents vs. 43% for new systems development.

- Most software maintenance fell into one of three classes: corrective (in response to a failure of any kind); adaptive (in anticipation of potential failure); perfective (refining the system for efficiency or user enhancements).

- About 51% of the maintenance effort was spent on perfective procedures, 24% went for adaptive measures and 22% was for corrective maintenance.

Based on his findings, Swanson concluded that "user demand for enhancements and extensions (as opposed to faulty original specifications) is the most significant problem in software maintenance."

THE ASCII TERMINAL FROM QUALITY YOU CAN SEE FOR CALL FOR OUR NEW 15-DAY

Software Engineer Training Programs Urged

By Brad Schultz
CW Staff

ANAHEIM, Calif. — The U.S. needs more software engineers, but is only beginning to train them in formal university curricula, according to speakers at a National Computer Conference session here last week.

The DP community still argues about what "software engineering" means, but the term is usually applied to the study and practice of developing computer programs as efficiently and effectively as possible. Some of the nation's universities have started offering courses in the subject, usually under the aegis of the computer science department.

But software engineering is not really an area of computer science, according

to Walter Karplus, a professor of computer science at the University of California at Los Angeles. And many computer scientists want no part of curricula that present methods of solving mundane DP problems irrelevant to their particular research interests.

TRW-UCLA Venture

Several schools have turned to private industry for help in training software engineers, such as the joint venture by TRW, Inc.'s Space and Defense Systems Group with UCLA.

Panelist Josh Hurvitz, who administers the project for the aerospace firm, said the two-year program is offered to the TRW division's entire professional staff, although applications are approved on a selective basis.

Under the program, TRW employees work half-time for the Redondo Beach, Calif., company and study

CW at NCC

half-time at UCLA's Computer Science Department through the regular academic year. They work full-time during the summer.

The program culminates in the awarding of a master's degree in computer science, although the coursework is addressed to software engineering rather than theoretical subjects. According to Hurvitz, participants usually stay with TRW after completing similar fellowship pro-

grams the firm has offered. However, this program has just begun, and attrition estimates are premature, he said.

When the first cycle of software engineering education is completed next year, most graduates will probably return to full-time employment at TRW as leaders of project teams or entire development projects, Hurvitz predicted.

Is TRW worried about losing the software engineers whose education is subsidized under the program? Hurvitz indicated that graduates are expected to enrich the firm's stock of expertise and capacity for innovation.

At any rate, legal contracts requiring the graduates to stay with TRW for a specified period would probably be harmful, the corporate training manager said. The rookie software engineers would not be very productive if a contract was all that kept them from jumping to other employers, he speculated.

Harvey Mudd Program

Harvey Mudd College trains software engineers by soliciting jobs from private industry and government, according to Stavros Busenberg, the mathematics professor who administers the Claremont, Calif., college's work/study program.

Harvey Mudd students get class credits for their efforts, which help the sponsoring organizations develop software systems for their own purposes, Busenberg said. The companies and agencies must pay the costs incurred by the college, but do not pay the students.

Only a few software-related projects are now under way. Most of the projects, which normally must be completed within an academic year, involve other technical disciplines.

The Harvey Mudd program and most other software engineering programs at U.S. universities demand proficiency in technical writing and other skills, such as public speaking.

According to UCLA's Karplus, the training of software engineers bears little resemblance to the training of the well-established categories of engineer.

Mechanical and electrical engineers generally study fundamental subjects in mathematics and the natural sciences before proceeding to applied sciences and finally to the technology they will employ as professionals, Karplus pointed out. This approach tends to grind out creativity in the student, the computer scientist asserted, and rewards compliance with fairly rigid methodologies.

In contrast, freshman and sophomore computer science students usually combine a wider range of nontechnical subjects with subjects related to their majors, Karplus observed. At that level, the students are typically involved with learning algorithms.

Thus, mechanical and electrical engineering students follow a pyramidal route toward their professional objectives. In contrast, software engineers take an inverted pyramidal course, starting with slow commitment to technology and increasing that commitment steadily with time.

As a result, today's computing students generally have far more liberty in structuring their involvement with technology than students in other technical disciplines, Karplus said.

Use with an IBM or non-IBM computer

Our IBM 3101 is a simple-to-use, versatile ASCII terminal that can be attached to most business computer systems — IBM or non-IBM — or used to access many remote computing and time-sharing services.

Whether your applications are budgeting, engineering, financial planning, interactive problem solving, or even simple data entry and retrieval, there's a place in your business for the 3101. Prices start at just \$1,295 for the character transmission models.

If you're now using a hard-copy terminal to perform computer-based inquiries or calculations, the 3101 can display your information faster on a high-resolution video screen. And if you're currently using a display, compare it to the 3101. We're so convinced of its high quality that we're offering a 15-day trial so you can see for yourself.

Order it with a toll-free phone call

You can order a 3101 by just calling our toll-free number. In the continental USA, call 800-431-2670. In

New York, call 800-942-1918. In Alaska, Hawaii and Puerto Rico, call collect 914-696-6840. You'll talk to a specialist who can take your order or answer your detailed questions. Delivery of the 3101 can be as soon as 45 days.

Out of the carton and into operation

When the 3101 arrives, you simply connect three modular elements — the display, the logic element and the keyboard — plug it in, position the setup switches and put it into operation. It takes just a few minutes. The 3101 weighs 38 pounds so you can move it easily.

Human engineering inside and out

The 12-inch diagonal screen can be swiveled and tilted to cut interference from overhead lighting. It displays a maximum of 1,920 characters in 24 lines. You can select green characters on a black background or black on green. And there's a detachable contrast-enhancing filter to reduce glare.

A low-cost printer, too

You can couple our 3102 printer to the 3101. You'll have the double convenience of displaying all your information, while capturing a hard copy of the data being displayed. The 3102 printer is lightweight and priced at just \$1,295.

Selected specifications and prices

There are two 3101 configurations: character transmission and block transmission. Character transmission lets you use it like a teletypewriter. Block transmission provides sophisticated editing capabilities, such as insert/delete and full cursor control, along with field functions like blinking, high intensity and protected fields. Both models can generate all 128 ASCII codes.

Accessible setup switches in the keyboard let you select functions such as line speed, parity, scroll and reverse video. The movable keyboard is much like the IBM Selectric.TM

The prices for the display terminal start at \$1,295 for the character transmission model, and \$1,495 for the block model. Volume procurements can save you up to twenty percent for either configuration of the terminal. Prices and current schedules subject to change.

RS-232C FLOPPY DISK STORAGE

IBM DOUBLE DENSITY
DUAL HEAD FLOPPY
HIGH PERFORMANCE
MODEM CONTROL

Add over 2M bytes of floppy disk storage to any host minicomputer, microcomputer or terminal. The SMS FT02271 provides an industry standard RS-232C interface to simplify connection to your host system. Industry standard IBM 3740 and 2D formats insure diskette interchange with other systems.

Easy to use ASCII commands allow adaptation of the FT02271 to data collection, program storage and data input applications.

Either ASCII or transparent binary data may be transferred continuously at up to 19.2K baud (even across track boundaries!).

Front panel switches allow diskette copy and formatting without host computer supervision. Resident self test and diagnostics may also be initiated from front panel switches. All this in a 5-1/4" table top or rack mounted enclosure.

IBM 3270 USERS

ISI makes your 3270 system do things that IBM doesn't

ISI takes over where IBM leaves off. For example:

Want high speed printout up to 300 lines per minute... now? Want to print labels or tags with large, readable characters? Want executive quality printout for word processing applications? ISI offers this and more!

Interface Systems, Inc. specializes in making IBM 3270 systems more versatile with a broad series of printers not available from IBM. They are plug-for-plug compatible with IBM 328X printers and ready to run on your system. And they are available within 30-60 days upon receipt of order.

Like more information? Call or write today. We will give you inquiry prompt attention.

Semantic Integrity Seen Step to End 'Garbage' In Distributed Data Bases

By Marcy Rosenberg
CW Staff

ANAHEIM, Calif. — Data errors in 20% of the Social Security Administration's files resulted in unfair payments or failures to pay.

Similarly, 20% of Internal Revenue Service records contained data errors of some kind.

And the New York Legal Aid Service, which prepares criminal records, reported that only 27% of its files were correct.

Speaking at the National Computer Conference here last week, computer scientist Elizabeth N. Fong threw out these statistics to hammer home a point: "Garbage in, garbage out" becomes "garbage in, garbage stay" when adequate controls are not in place to ensure that data within a data base is logically correct.

A step in the right direction is to develop data base semantic integrity, according to Fong, employed by the National Bureau of Standards' (NBS) Institute for Computer Sciences and Technology, which is building an Experimental Semantic Integrity System. (Xsis).

Because semantic integrity is concerned with the logical meaning of data, it helps control three sources of data errors in a data-base management system (DBMS): incorrect entry, system failure and, to a greater extent, conflicts with the intended meaning of the data, according to Fong. This latter problem occurs when the perceived interrelationship among DBMS data is violated.

By specifying value ranges, for example, semantic integrity could detect the error in entering a person's weight as 570 kilograms instead of 70 kilograms, she explained.

The goal of semantic integrity, then, is to begin with a clean — semantically correct and, therefore, logically correct — data base and make sure that subsequent updates also result in a clean data base.

This goal remains an elusive one, Fong admitted. The reasons? Individual updates may involve operations across data structures, may require several statements of the data manipulation language and may involve logically interrelated data.

Further complicating the matter is the fact that the understood meaning of data is usually not formally expressed.

Approaches to Integrity

Nevertheless, different approaches to semantic integrity have surfaced, although most have trade-offs. The two primary methods, an assertion-based approach and data type checking, are no exceptions, Fong noted.

Since the assertion-based approach allows users to specify those semantic integrity rules that seem important, it offers the advantage of incorporating semantic integrity capability on an incremental basis.

But the disadvantages of this approach are threefold, according to Fong. First, it cannot determine how complete a set of rules is since there is no basic point of reference; second, it opens up the possibility that adding a

new rule will show that a data base previously thought to be semantically correct now suffers from integrity violations; and third, it involves significant overhead by requiring that consistency checks on the collection of

CW at NCC

rules be incorporated.

The advantage of data type checking, Fong said, is that strong data types are constructed from system data types, thus allowing type interrelationships to be formally specified through aggregation and generalization. Such specification permits semantic integrity assertions to be checked statistically at compile time rather than at runtime and can show how complete and consistent the data type specifications are.

On the other side of the coin, this approach requires complete specification, a major effort when talking about significantly large data bases, Fong said. Another drawback is that semantic integrity requirements which are value- rather than type-oriented cannot be specified.

Combination Approach

A combination of the two approaches may prove to be a better semantic integrity system, Fong maintained. To implement such a combined method, however, requires three components — rules specifying both type- and value-oriented semantic integrity constraints, a process for checking conformance with these rules and the actions which should occur when integrity violations are detected.

This method, in theory at least, would be structured to provide semantic integrity while supporting uniform access to multiple, remote, heterogeneous DBMS, according to Fong.

Enter Xsis, the prototype semantic integrity system NBS is developing. Its design is intended to blend both the assertion-based and strong data type approaches to semantic integrity.

Xsis is designed to operate as part of a distributed network environment supporting different multiple and remote DBMS provided by an Experimental Network Data Manager (XNDM). Both Xsis and XNDM are implemented in C language on a Digital Equipment Corp. PDP-11/45 attached to Arpanet and running Bell's Unix operating system.

The intent is for Xsis to act as a filter for checking remote data base operations expressed via XNDM's experimental Data Language (XNDL), remarked Fong, who is participating in its development. Xsis, which views semantic integrity as a system rather than as user responsibility, consists of two components. One supports constraint specification and maintenance; the other supports constraint evaluation and enforcement.

Asked about the overhead that would be associated with gaining semantic integrity, Fong said it could be "very large." She admitted users may have to trade off performance for integrity.

Information Technology to Shape Decade: Imlay

By John Whitmarsh
CW Staff

ANAHEIM, Calif. — The technological achievements of the past may belong to the space and medical industries, but the decade of the 1980s belongs to information technology, according to John Imlay, chief executive officer of Management Science America, Inc. (MSA).

Imlay, who steered MSA from the brink of financial ruin and transformed it into one of the largest software developers in the world, urged his luncheon audience here to forget the concept of computing as they have known it.

"We are no longer in computing. It is no longer DP. It is information technology, and it is the brightest industry of the '80s, brighter even than energy," Imlay declared.

Areas of Promise

The forces promising a bright future in information technology are already in place in six areas, Imlay said:

- **Manufacturing.** IBM has led the field in computer manufacturing, but of late the industry giant has encountered problems of cash flow and unreliable software development.

Problems of cash flow generated by users switching from purchase to lease of IBM equipment are temporary and will be solved by the mid-1980s, but the problem of unreliable software — "the System/38 was a miserable software failure" — will plague IBM through much of this decade.

- **Acquisition of computer service companies.** The trend began in the waning years of the '70s, but is expected to accelerate in the '80s. Ten computer service companies already top \$100 million in revenues.

Acquisitions such as the purchase of National CSS, Inc. by Dun & Bradstreet for \$163 million in cash and the acquisition of Data Resources, Inc. by McGraw-Hill, Inc. for \$103 million are but two examples of the acquisition activity expected in the immediate future by large corporations on the acquisition kick.

- **Communications.** "Here's the biggest revolution in our industry," Imlay said, and it will include everything from fiber optics to earth stations.

One indication of the future was the recent announcement of a joint venture by Communications Satellite Corp. and Sears Roebuck & Co. to market a 9-in. dish antenna to communicate with satellites whirling around the earth from home or office. Cost of the new dish: \$350.

But the communications revolution will receive its major impetus from the looming battle between IBM and AT&T. When prices for communications services and equipment begin to plummet from competition between the two companies, the revolutionary spark will have been kindled, Imlay forecast.

- **Word processing.** It's only in its infancy, according to Imlay. As the fore-runner of the office automation revolution, WP will be tied to central computers and will be a major responsibility of DP managers, Imlay predicted, hinting that control of both WP and DP should remain in the DP manager's camp.

The world of WP will be wracked by two other trends. First, Imlay pre-

dicted that "word processing companies by the end of the decade will turn into minicomputer companies as the office automates and every desk

CW at NCC

houses a minicomputer."

Second, Imlay emphasized, Exxon Information Systems will emerge as a key influence in the direction of the office of the future.

- **Personal computers.** Homes will open their doors to personal computers in the '80s. Only three personal computer companies are now on the scene, but by the end of this decade more than 100 personal computer

manufacturers will vie for the attention of home users.

Entrance into the home will be eased by young children who, in contrast to their parents, know no fear of the computer. And this new generation of children nurtured on the computer may hold some promise for the personnel problems of the '80s and beyond, Imlay intimated.

- **Software.** The accent of the '80s is on software and its effective application to business problems. Over 750 companies now sell software packages, and their combined revenue this year will top \$1 billion, Imlay believes. The number of software offerings alone has increased from 398 in 1968 to 5,116 last year, Imlay noted.

Compliments of Intel

Information Resource Management Seminars

From New York to Los Angeles, in key cities across the United States, Intel is spreading the word about Information Resource Management (IRM). Presenting our industry's innovative best, Intel's seminars focus on a new methodology and a new product line tailored to productivity and performance issues of the 80's.

A Fact-filled Event

Providing vital guidelines for the most important software decision you will make, this complimentary seminar series introduces the concept of advanced Information Resource Management, presents the advantages of an integrated data dictionary, examines data base management requirements, and reviews Intel's real-life solutions to application problems. Beneficial to both managers and technical personnel, the series also highlights Intel's new IRM product family

comprised of data base hardware, data communications, distributed data base facilities, and the IDD integrated data dictionary with its SYSTEM 2000®/80 data base management system.

Your Host: An IRM Expert

Hosting the occasion is a respected member of Intel's staff with many years of data base design and application experience. His goal is to effectively communicate Intel's Information Resource Management expertise and illustrate its relevance to your goals.

To RSVP

Check the seminar schedule listed and call Intel's Market

Information Office at 512/258-5171 as to when and where you can attend. Or, simply return the invitation and we'll reserve your place. Compliments of Intel.

Study: It's Not Money That Motivates DPers

By Bruce Hoard

CW Staff

ANAHEIM, Calif. — Social studies show that DPers exhibit unique psychological characteristics that set their motivational needs apart from workers in any other profession, panelists at the National Computer Conference said here last week.

Dr. J. Daniel Couger, professor of computer and management sciences at the Univer-

sity of Colorado, and his colleague, Dr. Robert J. Zawacki, assistant dean of the school's

need strength."

Those two categories represent only two of several they

CW at NCC

College of Business, found in a study they conducted over the past three years that DPers have extremely high "employee growth need strength" and extremely low "social

used to detail the motivational needs in a DP industry currently experiencing what Zawacki labeled "28% to 30% turnover rate."

That high rate and the nose-

diving productivity associated with it were the main reasons Couger and Zawacki, who have co-authored a book entitled *Management and Motivation of Computer Personnel*, decided to conduct their study. Working from a data base of 6,000 DPers representing a cross-section of industry employees, they concluded that job dissatisfaction resulting from insufficient motivation is eviscerating the DP

ranks.

"The motivational concept is hard to talk about," Zawacki said. "You can't taste it, you can't feel it and you can't smell it. In addition, like most concepts, it is a controversial thing."

Real Reasons

The academician debunked the idea that salary is at the root of employee turnover, attributing it instead to failure to pay proper attention to the "hygienic factors" originally developed by MIT social scientist Fred Herzberg in the mid-1950s. Those factors take into consideration such psychological factors as achievement, advancement and recognition, Zawacki said, claiming it is these factors — not money — that most deeply concern workers.

He identified five "core job dimensions" that parallel the hygienic factors principle. They are skill variety, task identification, task significance, autonomy and feedback.

Couger advised that "supervisors should look at each of these five and ask, 'What can we do to enhance job positions?'"

Skill variety refers to the different tasks a worker performs in his daily duties, Couger explained, suggesting that programmers mired in maintenance be given more training to make them feel as though they are working toward better positions.

Task Identity

Task identity is the ability of workers to relate to the wholeness of a project on which they are working. A computer operator would feel a much stronger task identity if he were periodically visited and briefed by a design team that could portray his role in the total operation, Couger pointed out.

How a worker and his co-workers feel about his job constitutes task significance. Data entry people would be motivated if users were occasionally brought in to talk about the impact and importance of their work.

"People want and demand challenges and goals," Couger said of autonomy. "They also want to set deadlines on projects and then work toward them under their own supervision."

In a typical case, an analyst might discuss long-range plans with his supervisor, Couger said.

The last core job dimension, feedback, is sorely lacking in many DP operations, Couger said. If performance standards were established for data entry and control people, their productivity would increase sharply, he argued.

You can't choose the right peripheral if you don't have a choice.

"Choice is our business."

At the David Jamison Carlyle Corporation, we don't provide just one or two lines of computer terminals, printers and telecommunications equipment.

We carry them all.

So besides true one-stop shopping and all the benefits that go with it, you get a sales organization that's in the business of providing you with exactly the right product for your application.

Our sales representatives are computer industry pros. Long on experience. And trained to understand your application down to the smallest detail. Only after we

completely analyze your needs do we provide you with a choice of the best-suited products for the job. You make the final decision.

On top of all this, DJC gives you a corporate price schedule with mix and match group discounts. So no matter if you're a single or a multi-operation business, you get a price based on corporate wide purchases.

So the next time you need a peripheral, give yourself a choice. Call DJC. If we don't have it, chances are it hasn't been made yet.

After all, you can't choose the right peripheral if you don't have a choice.

Women Managers' Concerns Dominate Discussion On 'Change Management'

By Rita Shoor
CW Staff

ANAHEIM, Calif. — The session was titled "Change Management" with "Woman in DP" listed as the subtitle. But from the reactions of the attendees to the discussion which took place in the latter portion of the session, change management took a definite second place to the concern over problems of women in DP management positions.

"Many of the more blatant forms of prejudice [against women] have been diminished," Ida Mason, professor of business information systems at Lehigh University, told the National Computer Conference session here last week. However, women can only manage change effectively for their own benefit and that of their organizations if they keep in mind the "realities of society" and some problems caused by their own attitudes.

Among the factors mentioned as affecting women in management were problems with traveling alone in a large city, the pairing of men and women for business trips and the problems of relocation for promotion if it means that a husband will lose his job.

Among women's attitudinal problems, according to Mason, they frequently attribute another woman's success to luck rather than ability and women tend to have a higher opinion of a man's work than identical work performed by another woman.

Female managers tend to hire males, Mason said. "It's something like IBM — it's a safe route."

Problems of Relocation

At this point, session leader Lorri Pitchell from Burroughs Corp. posed the question of promoting married women to positions that would involve relocating their families. She addressed the question to both Mason and Al Orsava, executive director of information systems for the municipality of metropolitan Toronto.

Orsava, who served as "devil's advocate" and took the negative position during the discussion, stated that special considerations must be made for women when considering relocation. The age of a woman, whether or not she has children and how long she has been married are definite factors which might affect a move, he said.

"Women think of themselves as managers only during working hours," he continued. "A man lives to work, while a woman works to live." He said he would only offer a job involving relocation to a woman if she came up with the right answers to these questions.

One session attendee objected to this strongly and pointed out that she had moved her family twice in order to advance her career. "My spouse is smart enough to find another job," she said, "and I'm willing to accept a temporary decrease in income if necessary."

Both Mason and Orsava agreed that this woman was in the minority and, Orsava continued, "remember that it's only in the last 20 years that women have become a major factor in the

work force. It is their responsibility to implement attitude changes because they are the new factor."

When another member of the audience said that she was "horrified at what's been said" and continued with the recommendation that everyone work on changing their perceptions,

CW at NCC

Orsava answered, "Maybe I'm just more honest than other managers."

Pitchell then reminded the audience that Orsava had been invited to take part in the session in order to take the negative viewpoint towards women in DP management. Additional questions such as the difficulties women in upper management have in handling other women and the need for women to "play by the rules" were discussed in a relatively calm atmosphere.

Need for Formal Approach

No questions were asked about the first part of the session, which dealt with the need for a formal approach to change management within both small work groups and the organizational structure as a whole. Pitchell pointed out this need when she stated that "one out of every three changes [implemented within an organization] fail."

Reasons for this failure when applied to implementing DP systems, she said, are:

- Frequent change of objectives or specifications (50%).
- Lack of communication between user and DP departments (25%).
- Inexperienced management (15%).
- Other (10%).

Cost and time overruns in developing the system, inadequate cost/benefit analysis and poorly assigned project priorities that do not reflect organizational goals are among the sources to which an unsuccessful change can be traced, according to Pitchell.

Three-Phase Process

Dynamics of the change process fall into three phases, characterized by Pitchell as "unfreeze, change and refreeze." The unfreeze stage is necessary because "change is initially perceived as threatening; any change will be opposed by a supervisor or by a worker unless he requested it." Pitchell quoted Kurt Lewin, coauthor of *Model of Change*, who wrote: "Any organization is unlikely to change unless it is hurting in some way."

Pitchell listed several techniques that might prove helpful in overcoming resistance to change:

- Taking into account the needs and attitudes of the people involved in the change.
- Identifying the managers with the greatest prestige and getting them to be advocates of the new system.
- Increasing the sense of group identity between people who would be affected by the change (users) and the "change agents" (DP personnel).
- Keeping communications open between user and technical departments.

Instead of Univac's U100 or U200, get Beauty & Brains.

FROM ECS. Direct Replacement. Plus Multiprotocol. The ECS 4000 and 4500. Two revolutionary new multiprotocol computing terminals. Remarkable in their external design and internal architecture. And they directly replace the Univac U100 or U200. Plug for plug.

Added Attractions. Full compatibility, of course. But you also get additional features in the bargain: such as the ability to share one printer among up to eight terminals. And to allow the host to communicate through a terminal to a printer, transparent to terminal operation. And that's just on the Model 4000.

Field Upgradable. Any time you choose, you can easily upgrade the 4000 to a 4500. Adding a dual minifloppy disk system. Which allows you to enter and store data off-line. Plus, a unique program that streamlines all disk functions to the protocol in use. And also provides a Transmit and Receive File facility which permits any terminal to send files to the host anytime.

Revolutionary! In the history of the computer, there has never been anything like the ECS 4000 and 4500. Multiprotocol capability matched with a repertoire of software and high level languages. Architectural elegance that will be emulated in the Eighties.

If you are a multiple unit end user seeking new alternatives in advanced performance, call ECS. The Information Architects.

DP Seen Political Aid in U.S., Threat in USSR

By Brad Schultz

CW Staff

ANAHEIM, Calif. — Computer technology helps U.S. public officials stay in power, but largely threatens the Soviet Union's political structure, according to panelists at a National Computer Conference session here last week.

U.S. government administrators often wield on-line data bases and other trappings of the technology as political weapons, Prof. William H. Dutton told the session on computing's "social dynamic." Systems give credence to policy decisions, the University of Southern California scientist explained, when they generate analysis to support decisions already made.

Of course, a U.S. policymaker likes

to say that the analysis preceded the decision and refuted alternative points of view, Dutton observed.

But computer technology undermines the far more centralized and bureaucratic political structure of the So-

viet Union, University of Virginia Prof. Seymour Goodman pointed out. In that country, top officials may lose considerable power if they let systems proliferate, giving lower level officials and professional people an unprecedented capacity for storing and manipulating data.

CW at NCC

Systems tend to leave audit trails,

which would embarrass lower level Soviet DPs, who often must break laws to acquire the resources they demand, Goodman said.

Support for Power

Computing power entails political power, the panelists agreed. In that respect, citizens' groups opposed to government policies are at a disadvantage if they lack systems to support their dissent, Dutton remarked.

Government agencies resist sharing of data, even when they join on-line networks, MIT Prof. Peter Keen noted. Data sharing generally becomes a question of competence, he said. Where two agencies see each other as equally competent, a "truce" may be arranged to permit mutual access

rights.

But an agency usually does not give data base accessibility to another agency it considers less competent as an evaluator of the information, Keen declared.

Agencies frequently squabble over interpretations of data, he said. The Texas public school districts have reportedly argued for years about how to define student absences, making computer records of student attendance useless.

Questions of Productivity

Besides the incentive to enhance political clout within an organization, U.S. DPs acquire systems to enhance the organization's productivity. But enhanced productivity is less attractive to Soviet DPs under certain circumstances, Goodman maintained.

Ironically, that is because most Soviet organizations are committed to filling production quotas, the University of Virginia scientist explained. The quotas are set annually on the basis of the previous year's output, he said. By drastically improving productivity through a major upgrade of computing facilities, a Soviet user would bind itself to far greater quotas for subsequent years.

Nevertheless, top Soviet officials are trying hard to raise the nation's output of goods and services, Goodman continued. Slow growth in white-collar productivity, which afflicts the U.S., is especially bad in the vast Soviet bureaucracy, he said.

Resolving the Problem

To resolve the problem, the Soviet Union has developed a number of computer systems patterned after U.S. models.

According to Goodman, the Soviets have successfully imitated IBM 360 and 370 mainframes, Hewlett-Packard Co.'s 2000 series minicomputers, members of Digital Equipment Corp.'s PDP-11 mini family, Intel Corp.'s 8080 microprocessor and the 6800 microprocessor from Motorola Corp.

The Soviets probably committed more capital to developing a replica of 360 operating systems than IBM did in turning out the originals, Goodman stated.

Systems Incompatibility

Although the Soviet Union is "arguably" the world's second largest computer manufacturer and has the strongest national contingent of mathematically oriented engineers, the software packages produced at central development plants seldom seem to reach a large portion of the nation's user base, Goodman observed.

The most likely explanation, he said, is systems incompatibility. The central plants may lose touch with the users, which are less able to meet with them and each other than are their U.S. counterparts. With far less vendor-user feedback, the Soviet DP community probably resorts to more independent systems "tinkering" when problems arise than does the U.S. community.

In response to a question from the session audience, Goodman said the U.S. intelligence community bears the closest resemblance to the Soviet users he described.

SPEEDWRITING FOR APPLICATIONS.

When was the last time you sat down at your desk, started your first cup of coffee and found someone had left your department a whole stack of applications to write. And they were all due yesterday.

If that's a situation that's all too familiar, or your programming department is too busy dealing with different computer languages, maybe you should be using a MODEL language.

MODEL is a versatile planning and modeling system that lets you use the English language to write applications. Which means you don't have to adapt to yet another new language before you start working. So your department can get a lot more work done in a lot less time.

MODEL offers all the advantages of computer-based technology without requiring technical computer experience. So anyone from executive management on down can use it to fit their needs—and all you have to do is let them know a MODEL language is available. Which means you can be spending less time writing programs for everyone else, too.

IF IT TAKES TOO LONG TO DEVELOP, IT'S NOT A MODEL LANGUAGE.

Besides being quick and easy to learn, MODEL offers FAST application development. Powerful debugging aids. Excellent diagnostic messages. And, MODEL is highly responsive. With on-line, conversational capabilities and instant feedback.

IF IT'S LESS VERSATILE, IT'S NOT A MODEL LANGUAGE.

MODEL has the versatility you need to solve complex problems. It will interface with existing data bases and applications and is available for in-house use or on commercial time sharing. And MODEL can be tailored to any industry or function. Because MODEL makes complex applications simple.

To make everything even easier, MODEL's flexible organization enables you to structure the solution to fit the problem. With multiple math sections, "structured modeling" and other convenient functions. Terrific reporting, forecasting, goal seeking and "what if" prompting are just a few.

IF A NON-PROGRAMMER CAN'T USE IT, IT'S NOT A MODEL LANGUAGE.

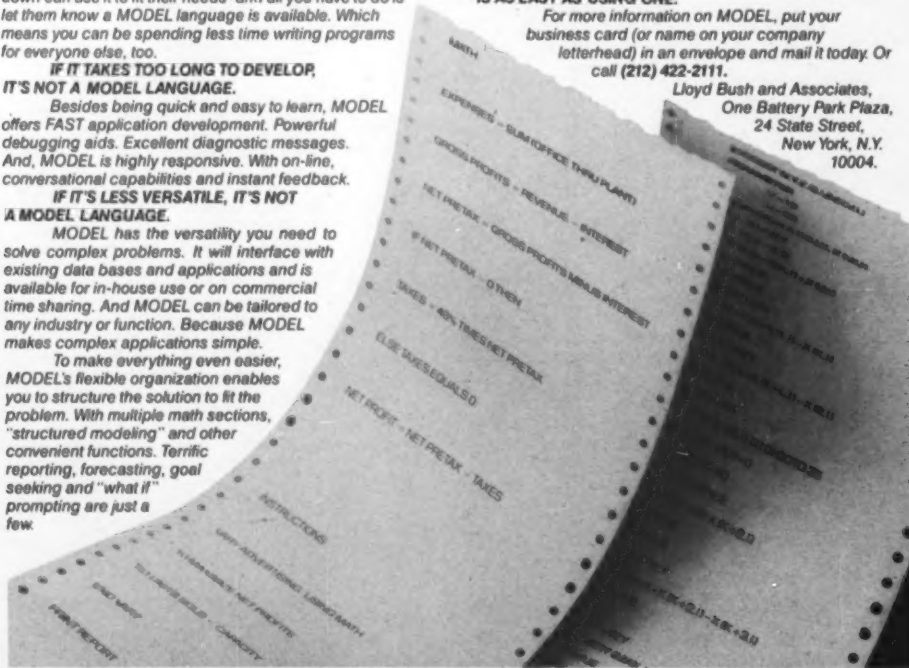

Because MODEL is based on the English language, non-programmers can use their own terminology. (MODEL is even multi-lingual, for use in your overseas operations.) So MODEL can be used for solving problems without creating new ones. MODEL is self-contained, with its own line editor, debugging facilities and other helpful aids. MODEL is also portable, so it can be used with many different types of hardware, or moved from one type of hardware to another. And to make using MODEL even faster, we've already developed applications for use in many different industries.

If you're still not convinced you should be using a MODEL language, it could be you've been working too hard. Which is all the more reason to get in touch with us. Now.

GETTING TO SEE A MODEL LANGUAGE IS AS EASY AS USING ONE.

For more information on MODEL, put your business card (or name on your company letterhead) in an envelope and mail it today. Or call (212) 422-2111.

Plan Predicts Viability Of DDP Configurations

By Tom Henkel
CW Staff

ANAHEIM, Calif. — The network configuration of a distributed data processing (DDP) system has a direct impact on how well a given system will fare when hit with a problem, according to researchers who spoke here at the National Computer Conference last week.

The survivability of such systems is being roughly predicted by means of a rudimentary mathematical formula developed by Richard Merwin, of the Department of Electrical Engineering and Computer Science at George Washington University, and Gene Hilborn, supervisor of advanced network planning for the Ford Aerospace and Communication Corp.

Merwin and Hilborn, who appeared on a panel here last week, said the plan may be the first step toward developing computerized analysis of the survivability of distributed systems.

Presented by Merwin and backed up by theory prepared by Hilborn, the plan rates DDP networks by their likelihood to create severe problems if one or more of the individual pieces of the network, or nodes, are eliminated. The program, prepared in PL/I and run on an IBM 3031, evaluates network configurations and rates them between zero and one. The more closely the evaluation approaches one, the stronger that system will be if parts of it should fail.

Maximizing Survivability

While admitting their research is still in the early stages, both Merwin and Hilborn said perfection of the computer analysis process could help users optimize costs in designing distributed systems.

The ideal, or "complete," distributed system is one in which each node is linked via a telecommunications network to all the other nodes in the system. Since the complete system would also be the most expensive in terms of telecommunications costs, not all users would want an all-nodes-linked type of system.

The challenge is to maximize a distributed system's survivability. Aside from the complete system, the most survivable type of configuration was a grid-type pattern that linked nodes vertically and horizontally. That configuration was further enhanced when

a diagonal link was added, Merwin said.

Other strong configurations included a semigrid pattern, where the center node in a nine-node box was linked to three outer nodes. That configuration received a .63 rating from Merwin's program while a somewhat weaker version of the same idea received a

CW at NCC

.601. In the latter configuration, the center node was connected to the outer ring of nodes by one link.

A swastika pattern received a .553 rating, and a weaker version of that configuration, a Z-shaped pattern, received a .49 rating, Merwin said.

A star-shaped configuration, in which all nodes had a single link to a central node, received a strong .632 rating. However, the Merwin program did not evaluate the system's vulnerability if the center node were eliminated.

The weakest type of distributed configuration was one where all nodes were linked in a straight line. Merwin explained that if one node were eliminated, the system would be divided into two subsystems. If vital programs or data were stored in one end of a straight-line system, one or both subsystems could be rendered useless, Merwin added.

Although the Merwin program — which he developed with Mohammed Mirhakak, a graduate student at George Washington University — made some headway toward computerized analysis of distributed networks, it also appeared to have some flaws.

The program did not take into account the importance of data or programs stored at an individual node. All nodes were treated as having equal importance, a concept that is not always carried out in real distributed systems, members of the audience pointed out.

A similar argument could be applied to Merwin's rating system. A strong configuration with a vital node eliminated could be more severely debilitated than a weaker configuration with several nodes of lesser importance eliminated, a member of the audience noted.

Memorex Madness

Diskomania reigns at Memorex Corp.'s NCC booth.

Instead of Honeywell's 7700 or 7800 series, get Beauty & Brains.

FROM ECS. Direct Replacement. Plus Multiprotocol. The ECS 4000 and 4500. Two revolutionary new multiprotocol computing terminals. Remarkable in their external design and internal architecture. And they directly replace the Honeywell 7700 or 7800 Series. Plug for plug.

Added Attractions. Full compatibility, of course. But you also get additional features in the bargain: such as enhanced editing capabilities. And a broad array of video format controls. And local data validation. And the ability to share one printer among up to eight terminals. And to allow the host to communicate through a terminal to a printer, transparent to terminal operation. And that's just on the Model 4000.

Field Upgradable. Any time you choose, you can easily upgrade the 4000 to a 4500. Adding a dual minifloppy disk system. Which allows you to enter and store data off-line. And which provides the equivalent of cassette handling capabilities, but with the speed of diskettes. Plus, a unique program that streamlines all disk functions to the protocol in use. And also provides a Transmit and Receive File facility which permits any terminal to send files to the host anytime.

Revolutionary! In the history of the computer, there has never been anything like the ECS 4000 and 4500. Multiprotocol capability matched with a repertoire of software and high level languages. Architectural elegance that will be emulated in the Eighties.

If you are a multiple unit end user seeking new alternatives in advanced performance, call ECS. The Information Architects.

Development of Ada Gets Mixed Reviews

By Phil Hirsch

CW Washington Bureau
ANAHEIM, Calif. — Whether the development of programming language Ada is being adequately coordinated was the underlying topic of a panel discussion here last week at the National Computer Conference.

Ada is named after the world's first computer programmer, Lady Ada Lovelace, friend of Charles Babbage. Under development since 1975 by the Defense Department's Advanced Research Projects Agency (Arpa) as well

as other U.S. and allied military agencies, Ada is expected to become the standard language used by all NATO na-

CW at NCC

tions for weapons system control, command and control and related applications.

Honeywell, Inc., which supplied the computer systems for the Defense Department's much-criticized World-

wide Military Command and Control System — better known as "Wimmex" — recently won the contract to design the final version of the language, subject to specifications which the U.S. and allied development group has just about finished drafting.

Meanwhile, a group within the American National Standards Institute is considering development of a commercial Ada standard. Communications protocol implementation is one likely application. Intel Corp. reportedly is supporting Ada in its new mi-

croprocessor series.

The chief critic of the Ada development process at last week's NCC session was Dudley C. Smith of Lear-Siegler, Inc. He suggested that the language is in danger of falling prey to the same infirmities that have beset Jovial (J3). Next June, Smith pointed out, J3 becomes the standard Air Force programming language, even though no standard, validated J3 compiler is yet available.

Users, as a result, will have to go through a cumbersome process of obtaining waivers allowing them to use prestandardized J3 compilers or other languages; the only other alternative, he added, is to delay pending procurements until a validated J3 compiler becomes available.

In the case of Ada, Smith said, the deadline for adoption of the language does not allow enough time for development, testing and validation of the compiler, text editors, debugging routines, and other environmental support. "It's an over-ambitious development schedule," he contended. "They're pushing the implementors too hard."

Smith also said the three military services should develop a standard procurement specification for Ada, pointing out that both the Air Force and Army have issued procurement requests for Ada compilers that differ markedly.

'Rich' Support

However, Dr. William E. Carlson, who heads the Arpa project team that helped develop Ada, said the Defense Department is planning to spend enough money on Ada to assure a "rich" support environment. He stressed that the validation requirement for all Ada compilers will assure not only that all the required features are present, but also that nonstandard features are omitted.

Once the Ada standard is promulgated, a "language control board" composed of representatives from all the participating military agencies will provide standardized solutions to disputes and adopt standard modifications as they are needed.

The basic goal of the Ada project, Carlson added, is to end the proliferation of special-purpose military programming languages. Their incompatibilities and obsolescence have created serious operational problems and unnecessary software expenditure; a big part of both problems is that most programmers are not familiar with any of these special languages, Carlson added.

Another Ada developer, Dr. Robert Firth of the British Royal Military College of Science, pointed out that in the course of the project, more than 600 papers commenting on various aspects of the proposed standard were received and analyzed and more than 200 written responses were sent back. There were literally thousands of informal conversations between the developers and the interested parties, plus "two or three" reviews of various chapters of the proposed standard, he added.

As a result, the latest version of the specification differs in many respects from its immediate predecessor. Most of the changes involve the sections on generic capability, separate compilation, testing and private types.

This mailer prepackages four jobs so you can get on with yours.

Don't waste time and money using your people to collate, insert, seal, and meter a mailing. Use our Envo-Mailer® continuous self-mailer instead. It has already done those jobs when you get it—as well as prevented insertion mixups of confidential information.

Envo-Mailers can include your message format—outgoing, return, file, and follow-up copies. Outgoing envelope—with postal indicia. Special inserts—check, ID card, label, coupon. Reply envelope too.

They're great for notifying, billing, persuading, polling, or just contacting customers, prospects, members, subscribers, voters, patients, students, alumni, or anyone else.

You get immediate delivery of stock Envo-Mailers, such as blank styles that let your computer print the format as well as the fill-in.

Maintain Lead in Research Or Lose Role as Leader, Packard Tells U.S. Industry

By Marcia Blumenthal
CW Staff

ANAHEIM, Calif. — The U.S. computer industry must continue to lead the world in the basic computer technology if it is to maintain its world leadership position.

"Japan and several other countries are increasing their research and development in computer technology, and if they gain a significant advantage in any area of technology important to future computer development, it could become a serious matter for our industry," David Packard, the chairman of Hewlett-Packard Co., warned.

More than 3,000 people crammed into a conference hall at the convention center here to listen to Packard's keynote address, which officially opened the National Computer Conference last week.

Funding Basic Research

Aside from serious rumblings from Japan, foreign competition, in Packard's opinion, is not the principle threat facing continued U.S. technological leadership.

Rather, he decried the lack of contribution by smaller firms toward research of basic industry technologies. "Much of the basic research in this country is being done in the laboratories of a few of the larger companies, notably Bell Labs and IBM," Packard noted.

Moreover, the availability of highly educated and skilled people will be a major determinant of progress in computer technology in the decade ahead, he added.

While Packard acknowledged that smaller firms can seldom justify in-

vesting in basic research, he repeatedly stressed the important role these companies can play in the development of technology through financial support of university research.

"I would encourage every firm in this industry to find some good university research program where work is being done in technology relevant to your company's interest and try to help ac-

CW at NCC

celerate this work with more financial support," the HP chief urged.

By cementing relationships with universities, companies will help create the environment necessary to attract the dwindling pool of talent to the study of computer sciences. A supplementary benefit is that many of these students may opt to work for companies supporting the research.

The decline in the birthrate will reduce by 21% the number of youths between 18 and 24 by 1995, he pointed out, emphasizing the seriousness of the shortage of talent.

But support cannot stop at the university level. Career patterns are often set at an early age, and if precollege education is inadequate, high school students will not qualify for the training they need to participate in a technologically lively industry.

"Young people seem to have an innate interest in computers, and whatever the industry can do to stimulate that interest could have a very large payoff in the future," Packard reasoned with the hindsight of approximately 50 years in the industry.

Industry and Government

Although some industry leaders have called for government support of basic technology research, Packard thinks this is unwise. "An industry environment that nurtures creativity and productivity is essential. The industry has generally enjoyed such an environment over the last several decades because there have been few government restraints."

Ironically, despite suggesting that industry avoid letting government solve its problems, Packard sees chief executive officers in computer firms spending more and more of their time on government relations during this decade. Packard advised executives it is in their best interest to work closely with government lest they sacrifice the creative environment that has been established over the past decades.

Without infringing on private industry, government can spur creativity by providing incentives for capital investment and rewards for innovation.

The reduction of the capital gains tax last year has already stimulated the amount of risk capital available, Packard said. He is also confident that Congress is receptive to returning to the old stock option rules, which imposed capital gains taxes on those exercising options when they sold stocks.

The present law levies taxes when the option is exercised.

Instead of Burroughs' TD830 series, get Beauty & Brains.

FROM ECS. Direct Replacement. Plus Multiprotocol. The ECS 4000 and 4500. Two revolutionary new multiprotocol computing terminals. Remarkable in their external design and internal architecture. Distributed Data Base Design Goals Addressed

By Marcy Rosenberg

CW Staff

ANAHEIM, Calif. — Distributed data base architecture should meet two key objectives: maximize site autonomy and distribute information logically as well as physically.

The advantages of such a distributed data base system are twofold, according to panelists speaking on network data base access at the National Computer Conference here last week.

First, the system is potentially more efficient than a physically centralized data base system because the data can be placed close to where it is needed.

Second, if data is needed at two or more locations, it can be duplicated, creating a potentially more reliable distributed data base system than a physi-

cally centralized data base because if one computer fails, others in the network can continue to operate.

While current research on distributed data bases aims to provide techniques

CW at NCC

that support the physical distribution of data items in a computer network environment, these approaches require a distributed data base to be logically centralized.

Dr. Dennis McLeod, assistant professor of the Computer Science Department at the University of Southern California in Los Angeles, stated a case for logical decentralization.

Discussing the limitations of the integrated data base — where there is complete centralization at the logical level — McLeod pointed out that it is often difficult to integrate completely applications that are related, yet separate.

Further, he said integration may go too far in tightly coupling together aggregates of data that should retain some individual autonomy.

Federated Data Base

An alternative approach presented by McLeod involves what he termed federated data bases, which he claimed strikes a compromise between total integration, or centralization, and the disorganization of completely diffused, or decentralized, data bases.

A federated data base consists of a

number of logical components, each with its own logical/conceptual schema, called a component schema. Typically, a component of a federation corresponds to a collection of information needed by a particular application or set of closely related applications.

What ties all components in a federation together is one or more federal schemata that are used to specify the information that can be shared by the federation components, and to provide a common basis for communication.

Issuing Transactions

In the federated approach, data base system users and application programs manipulate a data base by issuing transactions — that is, operations that retrieve information from or modify information in a data base.

Usually, a data base user or application program is affiliated with a single federation component and normally issues transactions that can be performed in the local component. McLeod called this property locality of reference.

When necessary, however, a user of one component can issue a transaction involving data that belongs to another component by consulting a federal schema to find the needed data.

The transaction involving nonlocal data is processed by issuing a request to a federal controller. Serving as coordinator and translator, the federal controller issues the necessary instruction to the other component to provide the data required.

Conflicts are resolved by what is called a federal data base administrator (DBA), which defines and controls all federal schemata, supplementing similar functions at the component level performed by component DBAs.

What this boils down to, McLeod said, is that the federated approach allows primary control over a data base component to reside with its principle maintainers and users, but also exercises centralized authority to ensure appropriate levels of sharing, data compatibility and data consistency.

Site Autonomy

Also desirable in distributed data base networks is site autonomy, according to Dr. Patricia Griffiths Selinger, manager of distributed data base systems at the IBM Research Division's Computer Science Department in San Jose, Calif.

While indicating that site autonomy is essential to maintain the efficiency and reliability that a distributed data base network can offer, Selinger noted that potential problems associated with site autonomy must be addressed.

For example, conflicts between compilation and authorization can arise if data from files at one site need to be merged with data from files at another site, and the local site is not authorized to access that data.

Ideally, Selinger said, site autonomy would permit descriptions of data to reside locally at the site that stores that data, with shared or replicated data stored at more than one site.

This "sounds wonderful," but can impact performance, she explained, pointing out that every time site A wants information about site B data, it has to access from site B. Her solution is to cache, or store, in site A frequently used site B data.

Here's the assurance you've been looking for!

HOW TO PROTECT YOUR IDEAS

by Stanley H. Lieberstein

An authoritative guide for:

- Engineers ■ Scientists
- Analysts ■ Programmers
- Researchers
- and other
- “high-tech” professionals!

Finally, in one comprehensive report — written by an experienced attorney — are the answers to the questions, the problems, the legal ins and outs of protecting the ideas you have or may come up with regarding new products ... new processes ... new applications of your technical expertise!

It happens frequently in today's fast-paced, technology-based businesses and industries. You're working on one project and suddenly you see the possibilities for a new program; an entirely different product or process; a new application of your technology to create either a completely original idea or a potentially profitable improvement to an existing product, program or process. What do you do? Consult an attorney? Take your idea directly to management? Or does your employer, in fact, already have a right to your brand-new discovery? How can you know? How can you protect yourself?

Written by a leading authority.

Author Stanley H. Lieberstein is a New York attorney specializing in patent, trademark, copyright infringement and trade secrets law. Former assistant and technical adviser to the U.S. Court of Customs and Patent Appeals, Mr. Lieberstein has also served as an examiner in the U.S. Patent and Trademark Office and as general counsel to a subsidiary of Occidental Petroleum Corporation. He is presently a member of the Board of Directors of the New York Patent Law Association and is listed in *Who's Who Among American Lawyers*. A recognized authority in the field, Mr. Lieberstein publishes frequent articles and conducts seminars for business and industry.

FIND OUT in the detailed, up-to-the-minute report, HOW TO PROTECT YOUR IDEAS

In just a few hours with the easy-to-read report, you'll learn your rights ... and how to protect them ... how to safeguard potentially profitable discoveries, processes, programs and other valuable possibilities!

Report includes:

- The three common-law principles governing ownership of ideas, inventions, discoveries! ...
- Two rules to know when you're working under government grants or contracts! ...
- The “hired to invent” test! ...
- The “shop-right” concept and how it may infringe on your freedom! ...
- Legal steps for “Reduction to Practice” — an essential for any invention! ...
- Clauses to watch for in your employment contract.
- When is technical information considered a “Trade Secret”?
- If you leave your present job, what information can you take with you? How can you legally use it?
- Computer software and the copyright laws! ...
- Invention Assignments, Confidentiality Agreements, Restrictive Covenants, and more — all describes in “plain talk” layman's terms!

For U.S. Impact Firms Warned to Track World Data Flow Laws

By Marguerite Zientara
CW Staff

ANAHEIM, Calif. — Although legislation governing transborder data flow has not yet heavily impacted U.S. and European business activities, nine foreign countries have passed laws that could soon cause serious problems for multinational U.S. firms.

That was the warning issued last week by Dr. Rein Turn, professor of computer science at California State University at Northridge. Speaking at the National Computer Conference session, "Privacy Protection in Transborder Data Flow," Turn identified seven major problems associated with transborder data flow.

First, in a transnational DP system with multiple participants, the question of who controls and is responsible for what data is unclear, Turn noted. In addition, there are no international standards for dealing with the issue.

Third, existing agreements — for example, Malaga-Torremolines — allow countries to monitor and stop data transmissions, he noted. Furthermore, there is no uniformity in the laws against interception of communications.

As the fifth and sixth problems, Turn cited the lack of laws against computer crime, as well as the variations in the technical characteristics of transnational systems.

Finally, he said sovereignty concerns may prompt the keeping of data and processing in domestic systems.

Different Attitudes

Turn then emphasized that the U.S. and European countries have essentially different attitudes toward transborder data flow legislation. "While European nations will see a potential problem and pass legislation to deal with the eventuality," Turn said, "the U.S. will realize there is a problem here and now and then pass legislation to counter it."

In light of this and other essential differences between U.S. and European privacy protection attitudes, Turn suggested "it is important for U.S. enterprises involved in transborder data flow to convince the privacy protection authorities in the countries in

which they operate of their commitment to privacy protection equal to the countries' own levels."

Throughout the 1970s, Austria, Canada, Denmark, the Federal Republic of Germany, France, Luxembourg, New Zealand, Norway and Sweden have passed privacy and data protection

CW at NCC

laws that are in varying stages of implementation, Turn said.

In the U.S., the Privacy Act of 1974, the Fair Credit Reporting Act of 1970, the Family Educational Rights and Privacy Act of 1974 and the Financial Privacy Act of 1978 are the federal laws in existence.

There are also five bills pending in the U.S. legislature and nine state privacy laws, none of which, however, is as comprehensive as the European laws, Turn indicated.

While the U.S. laws cover individuals and citizens, European legislation applies to all people regardless of citizenship. In addition, European laws ensure omnibus coverage, as opposed to U.S. area-by-area coverage.

Furthermore, Turn noted, European nations with such legislation also have licensing and regulatory commissions, whereas U.S. policy is largely that of self-enforcement.

On the other hand, "in order not to give a misleading picture of the level of privacy protection in the U.S.," Turn said, "it should be noted that the scope of U.S. privacy laws is broader. The laws apply also to manual systems, and private-sector privacy laws apply to all residents."

"More generally, the Constitution of the U.S. and those of the individual states place strong emphasis on openness in governmental decision-making processes and establish an atmosphere of concern for individual rights," Turn added.

"Practices such as establishing a universal identification number for each citizen or publishing the earnings and income of all citizens, as presently exist in Sweden, would not be acceptable to Americans," he noted.

Instead of IBM's 3271/3277 & 3275, get Beauty & Brains.

Terminal Gets Smart

Don Adams — better known as Maxwell Smart, Agent 86 — signs autographs at Hazeltine Corp.'s booth.

Different Expertise Demanded 'Retool' for Office of Future, Managers Advised

By Jeffrey Beeler

CW West Coast Bureau
ANAHEIM, Calif. — DP managers will have to "retool" their professional thinking and acquire new job skills to cope during the next 10 years with the burgeoning office-of-the-future movement, according to Johns-Manville Corp.'s telecommunications services manager, Dale Mullen.

The expertise that an office-of-the-future environment will demand from DP managers will differ sharply from the know-how such individuals learn-

ed as programmers or system analysts, Mullen said last week during a session at the National Computer Conference.

CW at NCC

To implement an office-of-the-future system successfully, DP managers will have to abandon their traditional role as mere technical specialists and increasingly master the skills of an effective "marketer," Mullen said. In other

words, they will have to take the lead in deciding what automated office functions their companies should install and then have the ability to persuade their superiors those functions are necessary.

They will also have to cease serving as mere implementors of corporate policy and instead become full-fledged managers with a strong voice in their companies' key business decisions, Mullen said.

Unfortunately, he added, many DP managers are ill-equipped by training to exercise the leadership and accept the increased responsibility that office-of-the-future systems will soon thrust upon them.

Mullen's comments came during an opening-day NCC technical session entitled "Management of Information Technologies in the '80s." Other panelists taking part in the seminar included Thomas Cross, communications director for the Communications Institute of Boulder (Colo.), and session chairman Frank Kline, vice-president of research for Drexel-Burnham-Lambert, Inc.

'Live the Dream'

Continuing with his remarks, Mullen told an audience of several hundred DP managers and others that the emergence of office-of-the-future systems will force DPs "to live the impossible dream."

They and they alone, he said, will bear the responsibility for deciding the modules of which an office-of-the-future system should consist and the standards which should be developed to integrate those modules.

No individual can reasonably be expected to accomplish such a feat singlehandedly, but DP managers will have to do the job anyway. They literally have no choice in the matter. Automated office systems are inevitable during the coming decade, and if the most computer-literate member of an

organization can't implement such systems, who can? Mullen asked.

The answer is simple. If top corporate managers cannot automate their offices through their own in-house DP departments, they will simply import the needed services by installing microcomputers from outside hardware vendors, Mullen said.

The prospect of microcomputer proliferation in the typical business office prompted Mullen to conclude that corporate DP departments are likely in the future to be relegated to mere "operations centers," with the bulk of the applications work done by the users themselves.

CW Photos by A. Dooley

Terminal Time

For Tektronix, at NCC it was obviously what was underneath that counted...

... While other terminal vendors managed to hang loose.

SNA/SDLC

The LogAbax 1067 is an efficient concentrator/converter which is used to connect ASCII terminals to an SNA/SDLC network.

If you already have a mix of ASCII CRTs and/or hard copy terminals, you can plug them right into a 1067 and turn them instantly into up-to-date SNA/SDLC stations. Up to five terminals, each operating at up to 9,600 Bauds, can be supported by a single 1067.

If you are acquiring more terminals, you can now choose from a wide variety of manufacturers and price ranges to get terminals that meet your needs. You may for instance choose the

new, low cost IBM 3101 CRT and turn it into a low cost SNA/SDLC station.

In either case, you will save on leased lines, modems and 3705 ports while getting terminals you really want.

1067 prices start at \$1,080 per terminal or \$62 per month on a three year lease.

Office of Future Called Boost to Productivity

By Bruce Hoard
CW Staff

ANAHEIM, Calif. — The office of the future will boost the production of white-collar workers, and many of its elements are available at low prices today, attendees at the National Computer Conference were told here last week.

"The office of the future has become a real buzzword, but it is closely linked with white-collar productivity," Carolyn Watteuw of Office of the Future, Inc. said.

Because business executives, not clerical workers, make decisions that affect the future of companies, they should be provided with equipment they will use enthusiastically, she added.

Typing is currently the biggest barrier preventing executives from readily adopting such equipment, she said, adding "a terminal with well-designed, programmable function keys can be bought off the shelf for \$2,000."

An entire office system can be bought for \$10,000, Watteuw said.

Sophisticated Tools

Although more sophisticated, voice-input systems will not be available "until 1985, realistically," a heuristic voice-input terminal can now be leased for \$180 a month, Watteuw said.

Another useful — but expensive — tool for the office of the future is the data base management system (DBMS), which Watteuw claimed can eliminate the most prominent cause of incorrect data — human error.

A DBMS for intelligent terminals can download host computer tasks while ensuring previously unattainable data accuracy, she said.

Saying "you can really give the executives some toys to play with," Watteuw strongly espoused the use of color terminals in automated offices.

Using color, executives can create variants and perform transanalysis, she said, adding that color coding can greatly facilitate the use of electronic mail by designating priority items to be sent.

Again, she noted, the drawback is cost. "You can spend up to \$50,000 on a good system," she said. However, such systems may soon be available

for as little as \$3,000 or \$4,000, she added.

'Active' Forms

"Active" forms will expedite transactions in the office of the future, Watteuw claimed.

In the case of a large sale, the form would be summoned to a CRT screen prompted to notify pertinent departments within the company, such as accounting and production, of the details of the sale relating to them, she explained.

Active forms require a host with at least 256K bytes of main memory, are commercially available and are inexpensive to maintain once the programs are written, she said.

In the area of storage for image processing, floppy disks are insufficient and video disks, although not widely manufactured, are the most likely al-

ternative, Watteuw said.

CW at NCC

ternative, Watteuw said.

Future automated offices will provide management with a variety of computer services, from text editing to screen writing on a split screen, she said.

Those services will be programmed with high-level languages but accessible to users via non procedural, English-like languages that will pro-

vide more system use, she noted. Turning her attention to communications, Watteuw said coaxial communications networks are feasible and advisable for large companies that are wiring entire buildings.

For those companies wishing to develop an "outside" system, she suggested the use of fiber optics.

"Communications is the backbone of office automation — not just hooking up to Telenet and sending electronic mail, but actual file transfer from host to host," she said.

Looking into the future, she predicted that by 1990, data, voice and image networks will all be combined as one corporate network capable of maximizing management efficiency.

The deal of 1980!

CP/M SOFTWARE: ACCOUNTS RECEIVABLE
ACCOUNTS PAYABLE
GENERAL LEDGER
PAYROLL

ONE TIME OFFER: For \$500.00, TCS Corporation's Microsoft Basic, CP/M compatible software sounds like a bargain. But, wait until you hear about it's many disadvantages!

A LITTLE HISTORY:

For the past four years, TCS Corporation has been selling Persec (MITS) business systems as one of their largest and oldest dealers. Since we were so early in the microcomputer marketplace, we were forced to develop an extensive array of business software. Some of this software has been marketed for years by Persec.

During 1978, a set of four business systems was developed for sale in the CP/M environment under the name "Peachtree Software". However, during this period there was a split among the principals which resulted in a parting of the ways — TCS Corporation and Retail Sciences (RSI).

It was decided that RSI would retain the "Peachtree Software" trademark and for a period of one year, TCS would be restricted from competing with them. So, for the past year, RSI has been enhancing and marketing their version, and now TCS is ready to market our version to you.

EXACTLY WHAT IS IT?

A fully integrated business software arsenal including:

General Ledger — provides immediate financial information for your company by keeping thorough record of all financial transactions.
Accounts Receivable — instant customer account information (current and aged) with complete invoicing and statement capabilities.
Accounts Payable — maintains complete vendor/voucher history including check writing capabilities.
Payroll — calculates payroll for every type employee while maintaining monthly, quarterly and yearly totals for reporting purposes in multiple states. User modifiable tax tables. W-2, 941's, etc.

TALK OF VALUE!

This offer is absolutely the best software value we have ever heard of. For only a one-time charge of \$500.00 you will receive all four systems to use at your discretion. They will form a solid base for your marketing efforts as they are or with your enhancements.

Before Accepting Financing Entrepreneurs Told to Know Investor's Motives

By Marcia Blumenthal

CW Staff

ANAHEIM, Calif. — The entrepreneur with a better high-technology mousetrap had better mind which path he takes to the investor's door.

With venture capital firms now investing more than a billion dollars annually, it is important for the would-be entrepreneur to understand the investment philosophy of various venture capital organizations.

This was the view expressed by some panelists during a recent National Computer Conference session here on venture capital.

In particular, the fledgling entrepreneur should be aware of the difference

between the motivations of the investment arm of a billion-dollar firm and the traditional venture capital partnerships, according to Gene I. Miller, a

— the apparent motivation of Exxon Enterprises, Inc. [CW, May 19]. Or a corporation could be searching for acquisition prospects, Miller noted.

Still another motivation for corporate investments is the opportunity for a spinoff, such as the formation of Axia Corp. from a venture started by Citibank [CW, March 10].

Recognizing the motivation of corporate venture capital entities, entrepreneurs may prefer to ally themselves with these units.

Why? For one thing, by affiliating with a corporation in a specific industry, the new enterprise gains broad assistance entering its selected industry segment. Assistance can be in the form

of management, marketing or the formation of licensing agreements.

Moreover, allying itself with a company like Xerox gives a new venture more credibility, Miller said. However, he pointed out that XDC, founded in 1975, operates along the lines of a traditional venture capital firm. To date it has funded 16 companies, including Apple Computer, Inc. and Paradyne Corp.

In making the decision to accept financing from a corporate venture unit, an entrepreneur should consider the ability of the corporate financier to respond to the needs of the new business and fit the venture into the structure of the corporation.

Importantly, the management of the young high-technology enterprise should be advised when the corporate investor will expect the venture to show results. Miller estimated it takes a startup venture about seven years to become self-sufficient.

Private Partnerships

Yet many up-and-coming high-technology firms avoid financing from corporate venture arms. Often entrepreneurs perceive that a corporation cannot move swiftly enough. William H. Draper III, a principal in Sutter Hill Ventures, contended.

Besides desiring independence, entrepreneurs opting for financing through private venture capital partnerships view corporations as having objectives other than investment, and this makes them leery.

Sutter Hill's motivation is purely return on investment. "If a company can't produce 10 times the original investment in four to six years, we forget it," he said.

A four-partner firm, Sutter Hill is one of the most active high-technology venture capital firms, with original interests in firms such as Prime Computer, Inc., Diablo Systems, Inc. and Qume Corp. Investing about \$10 million per year in about 12 ventures, which it pares down from some 400 inquiries, Draper said his firm invests almost exclusively in startup ventures proposed by one or two people.

In choosing its investment opportunities, Draper examines the market size for a firm's product and determines whether the market is ready for that product. In addition, the firm analyzes pricing for that product on a cost, demand and competition basis.

However, aside from all the traditional analyses, Draper said he spends a significant amount of time evaluating the management of an enterprise under consideration. "We are really in the personnel and not the finance business," Draper quipped, emphasizing that his firm often finds and hires the appropriate management for a firm. His firm spends about 50% of its time working out problems of the companies in its portfolio after the investment is made.

But the entrepreneur cannot be a partner for life, Draper advised. Eventually, "we have to decide when to take the return for the investment." In the case of Qume, Sutter Hill sold out for \$155 million on a \$2.5 million investment.

In 17 years Sutter Hill has divested about half of its 150 investments.

Corporate Venture Arms

Corporations committing capital through their investment capital units are often looking for technologies that will be the basis of market expansion

What do you do when your large-scale IBM is all batched up?

Call the second center facility you probably didn't know you had. The Sungard Center.

There are a number of different ways your large-scale IBM can be non-plussed by overload.

Which could result in the delay or deferment of a number of pressing projects. From new program development to critical application back-up. And cause costly overtime in batch or interactive processing, software conversions or systems development.

The Sungard Center can remedy this rapidly.

Sungard was established as a highly advanced disaster/recovery center. Utilizing IBM's largest computers.

We're glad to report that the response to this service has been over-

whelming. We're also glad to report that no one has yet had a disaster.

So now we find our 3033 has a lot of spare time on its hands. As will our shortly-to-be-installed 3031.

As a result, you have a second center capability at your disposal.

Able to take a big load off your mind. Or act as an interim facility until IBM introduces its new package.

We offer this spare time at extremely attractive rates. Because it's pre-emptible. In case the center is ever needed for disaster recovery.

Whatever the need, remember, you now have another large-scale computer to count on.

Announcing the broadest range of IBM-compatible computers.

National Semiconductor, our parent company, has been a manufacturer of IBM-compatible computers for over five years.

In fact, National has produced more compatible computers than anyone else. Now, with the formation of National Advanced Systems, we are a formidable force in the IBM-compatible field.

With the recent announcement of new members to our proven Advanced Systems (AS) product family, we now offer the broadest range of compatible computers on the market today. Computers that use a microcode-based design to insure compatibility with current IBM products and future enhancements.

Our systems offer the user significant advantages in terms of price, performance, reliability, support, and financing alternatives.

The AS/3000 Series. **Sometimes less really is more.**

Our AS/3000 is a medium-scale, highly reliable computer series that offers a performance range equal to an IBM 4341 on the low end, and a 370/158-3 on the high end. The AS/3000 is field-upgradable and supports all current and past popular releases of IBM operating systems.

In addition to purchase and long-term lease options, the AS/3000 may also be obtained through several highly competitive short-term leases of variable length.

The AS/5000.

High technology, low cost.

Offering superior performance and reliability at a lower price, our AS/5000 is the sensible alternative to the IBM 3031.

Through the use of advanced integrated circuit technology, the number of components, pins and connections in the AS/5000 is substantially less than used by IBM. The AS/5000 is also lighter, takes up less floor space, and uses about 50% less power than its IBM counterpart.

The AS/7000 Series.

Dependability you can count on.

Dependability is synonymous with our AS/7000 Series, the true price/performance alternative to the middle and upper end of IBM's 303X series.

The AS/7000 Series is composed of three field-upgradable models. The AS/7000N can be upgraded to the AS/7000, which can in turn be upgraded to the AS/7000PC, offering significant "in-place" growth capacity and

thereby protecting your investment.

And there's no waiting.

Our Advanced Systems are available now. So you can receive shipment of your computer when you want it—and need it.

If all this sounds interesting to you, contact your local National Advanced Systems sales office, or write to Marketing Dept. A1, 3145 Porter Drive, Palo Alto, CA 94304, 415/856-5000.

The compatible computer line from the Compatible Computer Company.

The Education of a British Prime Minister . . .

By Rex Malik

Special to CW

LONDON — "You pay for all of this?" Prime Minister Margaret Thatcher asked recently while looking at some data stream figures on the Prestel viewdata set. We were a number of frames in and she had just noticed a cost access figure — five pence — in the top right-hand corner of the frame.

"Why didn't you tell me?" she said in mock horror at the money that was being spent. Everybody laughed.

It must be great to be a prime minister sometimes. When you are on one of these meet-the-people or look-at-an-industry visits, not only will people go to great pains to explain anything and everything, but however weak your jokes, they always laugh.

If they can hear them. At times the visit was in danger of turning into a media event. Almost everybody had sent a photographer, and it was all one could do to hear Thatcher speak above the sound of camera shutters.

The prime minister was making her first visit to the British software industry. Indeed, as far as anyone could remember, it was the first visit of a UK prime minister to the systems and software industry.

The companies that had been chosen for her to see were Logica, Ltd. and Communications Systems and Planning (CS&P), two UK houses with considerable expertise in communications systems. Both make a substantial percentage of turnover contribution to British exports, both have U.S. offices and both have their headquarters in London's Marylebone district, which just happens to be the parliamentary constituency of Kenneth Baker who, more than 10 years ago, was the first member of Parliament to try to move a data protection act.

If Baker had chosen the companies Thatcher visited, he had chosen well. Both companies are success stories, Logica with more than 700 employees, CS&P with less than 20.

Until about a year ago, Logica was controlled by PRC. With the help of the National Enterprise Board, however, it

was bought back and is largely controlled by its executives. CS&P, which grew out of a university consulting group, is also controlled by its executives.

Logica last year had revenues of around \$27 million and, on the day of the prime minister's visit, was forecasting \$43 million this year, which it should make as the financial year ends on June 30. CS&P, by contrast, is forecasting around

\$1 million this year.

And whereas Logica now has offices in seven countries, CS&P is restricted to two: the UK and the U.S..

A Lot to See

There was a lot both companies could have shown the prime minister. Logica says that last year it undertook some 400 projects for about 250 customers. If there were a list of the world's 500 largest

computer users, many of them would turn out to be Logica clients.

Logica chose to show Thatcher four projects. The prime minister spotted a fifth and sixth across the room and went to look for herself.

Logica is managing the seven-country market trial of Prestel International's viewdata service. This is an attempt by the British Post Office to make the data bases on

Britain's Prestel also available internationally.

Naturally, Thatcher was shown joke files and games files: she played "Missionaries and Cannibals." It would not do for prime ministers to be seen losing in public, so before she did, she craftily handed over the conduct of the game to someone else. Any successful politician is good at that sort of game.

Thatcher was also shown

GE Engineering It's turned America's way

3M Facsimile Transceiver Top Cover
"70% cost savings compared to a sheet metal fabricated part."

Burroughs Redaction Corporation Word Processing System Housing
"The GE structural foam is the frame. The sheet metal is hung on it as a decorative element."

Xerox Corporation 9400 Duplicator Door
"Consolidated many metal parts into a single one of structural foam... remarkably high rigidity."

Digital Equipment Corporation Computer Module Base
"More than a \$40 per unit savings over cast aluminum... superior impact resistance in tests under load."

The outside and the inside become one with GE Engineering Structural Foam, the molding material so strong, rigid and stable it can eliminate all need for interior framing once required to support product components. Results: major cost reductions and design freedom that are attracting leading companies

Advertisement

**WATCH FOR
CAPTAIN INFO**

... Thatcher Visits the UK Software Industry

Icon, a computer-controlled graphics generator used by the British Broadcasting Co. (BBC) in its election coverage. Icon was developed by Logica and has since been sold to West Germany, where it was used in the recent coverage of the Rhine Westphalia elections.

Logica then showed the prime minister its word processing system, VTS, which is to be sold abroad. No. 10

Downing Street does not have word processing yet, and Thatcher was suitably impressed as she quickly realized her speeches need no longer go through untold numbers of drafts.

They showed her the BBC's Ceefax system, the British version of the teletext broadcasting system, for which Logica had written much of the software. And she went over to look at some on-line processing

("Let's get the pictures done first," said the prime minister, "then you can really tell me what this is about").

Highlight of Trip

Thatcher's next stop was to inspect the development of a computerized ticketing system for London Transport's underground system. But the highlight of the trip was her exposure to satellite image processing.

Logica representatives explained to her the work they are doing for the European Satellite agency and showed the results of satellite infrared photography on crop location in the south of England.

Thatcher had obviously been reading Frederick Forsyth's *The Devil's Alternative*: "Good heavens," she said. "I can tell anywhere in the world what they planted, when and how it is growing. So you

could know what the market is going to be and whether the Warsaw Pact countries are going to come in?"

It was explained to her that there were some technical problems to be overcome and that Europe would need its own satellites. There is a program coming up for joint European satellites in which, according to Logica Chairman Philip Hughes, it is hoped the British Government will play a part.

The point was taken. "But how many satellites would you need for total surveillance?" the prime minister asked. The complexities were explained.

"And how many does the U.S. have up?" she inquired.

"You may have access to that information," Hughes replied, "but we, Prime Minister, don't."

Conferencing System

At CS&P, Thatcher met the designers of the government's own trunk communications network. They discussed methodology to assess the benefits of investing in telecommunications in Third World countries.

The highlight at CS&P, however, was a contract for the U.S. Defense Department Advanced Research Projects Agency (Arpa). CS&P is the only non-U.S. company working on the design of a conferencing system which allows for encryption and data input. It is an audio and visual system which allows for speaker identification almost automatically.

Or, in the jargon, it allows for electronically mediated meeting, and a flip of a switch allows any of its participants to talk privately.

The specification CS&P is devising is for a no-expense-spared system. The facilities being simulated will even allow for translators to be cut into circuit so they can translate technical jargon into language the users can understand.

At that point, the press discovered the government has a system with many of these facilities, though the system is not so advanced. The prime minister said so.

There is known to be a private battle going on in Whitehall, the seat of government, over what, if any, policy the government should adopt toward the British computer and software industries — what sort of funds should be pumped in and how.

The battle has not reached the prime minister's level yet. But it will. One suspects that it will have done no harm to the protagonists of such a policy to have exposed Thatcher to the capabilities of the British industry.

Univac's Williams Sees Element Missing Handling of Manufacturing Systems Faulted

By Jeffrey Beeler

CW West Coast Bureau
NEWPORT BEACH, Calif.
— No DP department by itself can guarantee the successful installation of a computer-based production-planning and control system. For the implementation of such a system to go smoothly, DP managers have to work closely with their manufacturing-

department counterparts, according to C.R. Williams, vice-president and general manager of Univac's Americas Domestic Division.

Speaking at Univac's third annual seminar on productivity, Williams described manufacturing management's involvement as "key" to the successful installation of a production-planning and con-

trol system.

"Manufacturing managers," he said at the recent seminar, "know their problems better than any management information systems expert or computer vendor could ever expect to. After all, they're the ones responsible for [their firms'] overall productivity and production management."

Yet in many user organizations, manufacturing managers are never consulted when the time comes to install a production-planning and control system. Instead, the responsibility for implementing such a system and making it work is left entirely to the users' in-house DPs, most of whom have at best only a partial understanding of their

companies' production-related problems.

The widespread tendency to ignore production-floor managers during installation programs and to rely too much on DPs has led Williams to conclude that, in most companies, "the responsibility for manufacturing-system development is in the wrong hands." By all rights, he said, manufacturing and DP management should share the responsibility.

If they don't — if manufacturing managers are overlooked when users try to install a production-planning and control system — the projects "will fail — it's that simple," Williams said.

Solutions for Users

In other remarks, Williams expressed the hope that the "technology-driven" computer industry of the 1970s would give way during the 1980s to an industry increasingly driven by solutions to user problems.

Technological innovation has long been and almost certainly will continue to be one of the computer industry's main driving forces, Williams said, and no one should underestimate its significance, either now or in the future.

On the other hand, he explained, users and vendors alike should avoid becoming so preoccupied with technological progress that it monopolizes their DP thinking and blinds them to other computer-related issues.

As the new decade progresses, Williams added, the ways in which DPs have traditionally looked at the computer industry will gradually begin to change. Instead of being concerned solely with technology for technology's sake (as they have often been in the past), DP people should start thinking more about how to translate some of the industry's latest developments into solutions that users can apply to their everyday problems.

Unlike the 1970s, which were highlighted by rapid technological development, the 1980s should be characterized by a growing emphasis on "user-ability," Williams said.

FINALLY, A SMART TERMINAL THAT DOESN'T SACRIFICE FORM FOR FUNCTION.

THE ZEPHYR™ BY ZENTEC.

There's really only one way to appreciate our new Zephyr. On the seat of your pants.

Go ahead. Sit down and touch test the Zephyr's typewriter-style keyboard. It's positive, yet responsive to the touch. And it's laid out for operator convenience. Above the standard 96 ASCII keys you'll find 16 function keys that operate in both shifted and unshifted modes. To the right, there's a compact numeric keypad and a cursor control pad with centrally positioned home control, both functionally designed to help you process more data, more efficiently.

The keyboard's not our only stroke of genius, though.

Zephyr's CRT is a sight for sore eyes, too. The large 12" non-glare video display incorporates a high resolution P-4 phosphor that makes it easier for you to work with words. You can quickly address two full 1,920 character pages of video display and enhance displayed data with a choice of video attributes including dim, blink, blank, reverse video and underscore.

Zephyr functions in both conversational and block modes, too, so you can transmit data with each keystroke, or transmit only unprotected data within a protected form, greatly improving your system throughput. And because

Zephyr is a product of Zentec experience, you are assured of reliable performance, day in and day out. Year after year. You have our word on it.

Isn't it time you found out how much more our Zephyr can do for you and your CPU? Just call your nearest Zephyr distributor and ask for a demonstration. He's listed below. Or call us at (408) 727-7662 and ask for Ted Atlee. It could be one of the smartest moves you've ever made. Zentec Corporation, 2400 Walsh Ave., Santa Clara, CA 95050.

ZENTEC

Managers on the Move

SAMUEL MILLER has been named director of purchasing and information systems at Summagraphics Corp. in Fairfield, Conn.

Miller previously held positions in purchasing management and information systems with Sikorsky Aircraft and Burndy Corp.

He holds a B.S. in business administration from the University of Bridgeport.

...

CAROL J. NORVICH has been appointed director of management information services at Rust-Oleum Corp. in Vernon Hills, Ill. She will be responsible for the overall development and maintenance of all corporate computer services and management information systems.

Norvich, who joined the company in 1977, served as applications programming manager and lead programmer before being named to her new position. Prior to that, she was a consultant with Hewitt Associates, Lincolnshire, Ill.

She holds an undergraduate degree from Northwestern University and is currently pursuing an advanced degree from the Lake Forest School of Management.

...

GARY J. WORSHAM and **JAMES A. MCCOY** have been named to new positions in the Management Systems Group of United Gas Pipe Line Co. in Houston.

Worsham, formerly manager of financial systems development, was appointed director of financial systems development. He joined United Gas in 1976 as a senior systems analyst/programmer and has been systems super-

visor, systems manager and manager of financial systems development.

Worsham earned a B.B.A. degree in statistical analysis at the University of Texas at Austin.

McCoy, formerly systems supervisor, was named manager of systems planning and research. He joined the company in 1976 as a senior systems analyst/programmer. In 1977, he was named lead systems analyst/programmer and was promoted to systems supervisor in 1978.

In his new position, McCoy will be responsible for conducting short- and long-range planning, advanced application analysis, special studies and industry surveys. He also will be responsible for research activities into new industry trends, techniques and tech-

nological advancements for the Management Systems Group.

McCoy received a B.A. degree in psychology and accounting from the University of Houston.

...

DANA D. SQUIRE has been appointed director of a new corporate management information systems department at Kaiser Aluminum & Chemical Corp. in Oakland, Calif.

Squire was former Western Region group vice-president of Laboratory Procedures, Inc., a wholly owned subsidiary of the Upjohn Co.

At Kaiser, Squire will manage the functions of 10 corporate departments including DP operations, field systems telecommunications, sales systems,

benefit systems, payroll and personnel systems, accounting systems, procurement systems and plant manufacturing systems.

In addition, he will direct the systems departments of the corporation's U.S. and overseas plants and facilities, will coordinate the company's word processing functions, and will coordinate the time-sharing requirements of the corporation's divisions and the technical information services of its research and development center.

Squire holds bachelor and master of science degrees in chemical engineering from Michigan State University and an M.S. in industrial administration and a Ph.D. in industrial engineering from the University of Michigan.

Datapoint Users

How to get a printout of what you see on your Datapoint screen.

As a Datapoint user, you know how convenient it would be to print what your screen shows. But, until now, it couldn't be done.

For as little as \$37.50 per processor, you can give your Datapoint 1500, 1800 or 3800 this printout capability. And you won't have to change any of your programs, because it's designed for use during your normal operation.

The Innovators believe that

Inno-Print™ can help you save time and get the full benefits from your Datapoint system. In fact, we're so sure you'll like it that we'll give you our usual 30 day money back guarantee.

For more information, clip and mail the coupon. Or call us collect at 919/288-3961.

The Innovators™

Professional systems software aiding Datapoint users worldwide.

- ☐ Please send more information on your Inno-Print program.
- ☐ I have some questions about your Inno-Print program. Please call me.
- ☐ I would like to know what else you have to offer for my Datapoint system.

'Pay Was the Problem'

Postal DPer Give Mixed Views on Unionization

By Ann Dooley

CW Staff

FRAMINGHAM, Mass. — Some DPer like them, others want nothing to do with them.

They're unions — a prospect that is confronting managers and DP professionals alike. And the programmers and systems analysts who either are union members or work in a unionized DP shop express varying opinions on whether DP professionals should unionize.

Although DP unions are still rare, two departments in the St. Louis Postal Service turned to unions in the last several years as a way of coping with management problems.

The St. Louis Automatic Data Processing Center collects the time and attendance figures from 72 major post office centers in the western half of the country. In early 1978, 44 of the 52 data center employees ratified a union contract with the American Postal Workers Union (APWU). Job categories ranged from junior-level data control technician to senior systems analysts.

Pay Scale

"Pay was the problem," David Anderson, quality control officer (systems analyst), stated. The union was ratified to bring pay increases, but it "hasn't done anything for us," Ander-

son said, claiming that the pay scale actually decreased after union negotiations.

Unions are not ready to accept professionals, such as DP personnel, and negotiate properly for them, Anderson charged. The national union makes no distinction between professional and line people, he claimed, adding that until unions realize that different job categories have to be treated differently, there will be problems.

Anderson's local recently filed a lawsuit in the Eastern District Court of St. Louis against the U.S. Postal Service and the APWU regarding discrepancies in their recent cost-of-living raises. Depending on the outcome of

the lawsuit, union members may petition to have some jobs taken out of the union — namely, the professional-level jobs.

The professional DPer originally favored a union because they had invested time in their present jobs and were not interested in job-hopping — something done more frequently in the private sector. Most are in their mid-to late forties and are planning to retire when they reach age 55.

"If I were 30 years old, I would leave so fast the door wouldn't hit me on the way out," Anderson said. "But at my age, what does it take to stay another few years?"

Management did not object very much to the union either, Anderson noted. "But unionization, for us, wasn't everything we thought it was supposed to be," he said. One problem was that by law "we were limited to which unions could represent us and so we weren't free to choose what we thought would be the best one."

Positive Story

A different union story can be heard at the St. Louis Postal Data Center, which handles various financial functions for the Postal Service and which has been represented by the St. Louis Gateway local of the APWU since 1976.

Approximately one-third of the 300 people in the bargaining unit are union members. Many others have not joined because they are covered under union contract regardless of whether they belong to the union, according to Rita Garcia, accountant and union local president.

The union was voted in because of a lack of guidelines in promotions, hiring, raises and training, according to Garcia, who asserted that most people are very happy with the union representation.

Even management is very positive, Garcia said, noting that many of the managers had worked their way up and had been union members at one time. "The union created a system for both parties to work under."

The higher level DPer needed more convincing to accept the union, she noted. They considered themselves a unique breed and felt their jobs were a stepping-stone into management.

But the managers made greater demands on them than they had expected, and the increased responsibilities were not necessarily reflected in their salaries. When it became a pocketbook issue, the DPer started thinking union, she recalled.

Most of the problems apparent prior to unionization have been resolved or at least have the framework to be resolved, Norwell Smith, senior computer programmer, said. Smith joined the union because management was not giving people a "fair shake." On the other hand, John Gregory, senior programmer analyst at the center, has not joined the union because "it has made a difference at lower level jobs, but is a paper tiger at my level."

Unions can be very beneficial, but this particular union is not attuned to the specific problems that programmers and analysts encounter in their jobs here, he said.

A lot of companies turned to Nixdorf for

HELP!

Even the competition.

When we introduced the computer world's first "help" function, a lot of the competition stood up and took notice. Even IBM.

With this unique key, an operator can quickly call up "next step" instructions for performing various operations. As a result, operator efficiency and productivity can be dramatically enhanced with a single keystroke.

Recognizing a good thing, many of our competitors wasted little time in developing similar "help" keys of their own.

But we're not worried. Because the fact remains that Nixdorf data entry/distributed data processing systems are still the most flexible, easiest-to-operate, most cost-efficient in the world. And we can prove it.

If your data entry/distributed data processing system needs "help," turn to the company that originated it. Call this toll free number, (800) 225-1979, and ask for a local demonstration at any of our 120 locations throughout the United States. Nixdorf Computer Corporation, 168 Middlesex Turnpike, Burlington, Massachusetts 01803.

Micrographic Systems Division

"NCR Micrographic Systems enhance the value of your computer."

Information management can be a cost-effective resource for your company

There's a more efficient way to access computer generated information, and enhance the value of the computer to your operation at the same time.

How?

With an NCR Micrographic System, and the technology that converts data into its most useful format. A format that gives you complete control over information.

NCR Micrographic Systems are fast, accessible and very easy to use. Systems that maximize the value of the investment in your computer by

making data conveniently available to every facility in your organization, regardless of how small or remote.

NCR is a total systems company, the only computer manufacturer to provide complete systems capabilities. Our systems span the entire business computer range. In addition, NCR offers data terminals, communications networks, 25 Data Processing Service Centers and Field Engineers. We provide support when and where you need it. With this total systems approach to information management, it's no wonder NCR is a leader in Micrographics data processing.

Executives in major industries around the world are finding new ways to hold down operating costs. And, NCR Micrographics are making it happen.

NCR can make it happen for you, too. To learn about the Micrographic System that's just right for your business, write Micrographic Systems Division, NCR Corporation, Box 606, Dayton, Ohio 45401.

Software Snags Tied to Ineffective Systems Use

By Bruce Hoard

CW Staff

WOBURN, Mass. — Software productivity is "the principle obstacle to the effective use of computer systems technology," according to William F. Zachmann, research director of Information Systems Planning Service at International Data Corp. (IDC).

Zachmann made his remark

at the Expo '80 Conference and Exposition here recently.

The gap between white- and blue-collar production graphically portrays the problem, Zachmann said. White-collar productivity has shown no significant increase in the past 10 years, while blue-collar productivity has surged.

Hardware vendors are affected by low software productivity because they are

manufacturing more hardware than there is software to run on it, he said.

In order to alleviate that problem, large companies such as Burroughs Corp., Univac and IBM will be making more software announcements in the near future, Zachmann predicted.

IDC conducted a study of the software problem, focusing on ways to measure productivity, tools that enhance it and the impact of organizational climate and management practices on the motivation of systems development.

"One trend has become very clear. Over the past 15 years, the only generally used measurement of productivity has been lines of code generated per man-month," Zachmann said, and added that that measurement is outdated and misleading.

For instance, while some programmers write lots of code and get few usable results, the reverse can be true for others, he explained. Also, test code and code generated

and discarded may or may not be counted.

"What we really want to measure is usable systems product," he stated.

Bolstering Productivity

Some of the tools being used to bolster software productivity include higher level languages, on-line debugging and testing and structured design and programming.

But even though there is a widespread belief among programmers that higher level languages such as Pascal have advantages over Fortran and Cobol, 80% of DP shops surveyed still use one of the latter, Zachmann said.

Programmers are also enthusiastic about on-line debugging and testing, but managers do not value it and say it wastes CPU time, he claimed.

While 70% of the IDC survey's respondents said they utilized structured design and programming, many of them are actually gaining little from that use, he contended.

"Buying a Stradivarius does not make you a maestro," Zachmann said, referring to the mixed use of productivity tools.

Expecting Too Much

Jack Rosenbaum, director of the New York office of Higher

Level Software, said DPs frequently expect too much from software systems. When that happens, they may fail to utilize the system properly and end up with a decline in productivity. He dubbed that unfortunate man-machine interface "negative synergism."

Like Zachmann, Rosenbaum lamented the lack of precise productivity measurements and went on to say a system's success may be determined arbitrarily. "One person may have brought in a system, and it may be his goal in life to defend that system," he said.

Advocating a "modern approach" to applications development, Rosenbaum said the combined use of "structured diagrams" and testing models leads to a well-ordered assessment of software needs.

Structured diagrams attempt to show how different elements of a system are needed by showing the links of their functions by means of flow charts. This representation allows planners to more readily envision proposed systems, Rosenbaum said.

Just as important is the use of models; if used judiciously, they "simulate and study the performance of a system while establishing performance criteria," he explained.

A key perspective on a modern system...

COMPUTER PROGRAMMING AND ARCHITECTURE: THE VAX-11

by Henry M. Levy and Richard H. Eckhouse, Jr.

Designed for both the computer science student and the hardware or software professional, this unique new book offers a comprehensive system viewpoint to the programming and organization of today's computers. The conceptual approach presented in **COMPUTER PROGRAMMING AND ARCHITECTURE: THE VAX-11** is easily applied to other systems.

Focusing on the VAX-11, this clearly written book uses a step-by-step, two-tier approach. **PART I: THE USER ARCHITECTURE** discusses the basic concepts of programming and architecture, such as memory addressing and instruction execution. **PART II: THE SYSTEM ARCHITECTURE** covers the more advanced topics of input/output programming and the functions, resource management strategies, and underlying architectural support of the operating system.

COMPUTER PROGRAMMING AND ARCHITECTURE: THE VAX-11 offers detailed coverage, including flowcharts, sample programs and diagrams, on such topics as:

- **PART I: THE USER ARCHITECTURE**
 - Computer structures and elementary VAX-11 programming
 - Instructions and addressing fundamentals
 - Data-types and data structures
 - Comparative architecture

- **PART II: THE SYSTEM ARCHITECTURE**
 - Physical input and output
 - Support of an operating system
 - The VAX-11 operating system structure
 - Operating system interface
 - Efficient implementation of an architecture

COMPUTER PROGRAMMING AND ARCHITECTURE: THE VAX-11 contains 407 pages with 160 illustrations, including flowcharts and program examples and 25 tables. Problems appear at the end of each chapter. 3 appendices, bibliography, and index are included.

"The text is unique in addressing hardware structures and assembly language programming while also describing the interfaces and mechanics of an operating system; it introduces the fundamental hardware and software structures of a computer system. Another aspect of this book is its use of a modern computer system that contains process support as well as virtual memory..."

Thinking About Pointer System

FBI Abandons NCIC Message-Switching Plan

By Jake Kirchner

CW Washington Bureau

WASHINGTON, D.C. — The Federal Bureau of Investigation has abandoned its plan to operate a central message-switching system linking state law enforcement data banks of criminal records in favor of a decentralized communications system controlled by the states themselves.

Following congressional approval, the FBI National Crime Information Center (NCIC) is planning a feasibility study of an FBI Interstate Identification index (Triple I) — sometimes referred to as a "pointer system" — that states can access to find if criminal records are maintained on an individual by any other state.

Once that information is obtained, the inquiring state will communicate directly through the Phoenix-based National Law Enforcement Telecommunications System (Nlets) to request an on-line transfer of the needed records, according to Lawrence Lawler, NCIC section chief.

Triple I could replace the present Computerized Criminal History (CCH) program, which for about 10 years has been mired in political controversy over privacy issues as well as questions about whether a federal police force like the FBI should control communications between state police agencies [CW, May 28, Aug. 13, 1979].

According to Lawler, NCIC always planned to decentralize the CCH program, but Nlets did not have the DP capacity to offer the on-line communications necessary for a full interstate criminal records exchange. Because of a recent Nlets decision to beef up its DP capacity — it now has a redundant system based on two Digital Equipment Corp. PDP-11/70s — the FBI is no longer considering its own message switch, he said.

The object of message switching in general, either by NCIC or Nlets, is to allow all criminal records to be maintained at the state level and release the FBI from having to maintain a central records facility, a facility seen by CCH critics as a potential national police data bank.

Because Nlets is fully controlled by the states, FBI involvement in Triple I should not be so controversial, the bureau hopes.

Theoretically, this pointer-type system, supported by Nlets with files of single-state offenders in each state, should eliminate the need for the CCH program (the FBI's data base of multi-state criminal offenders), but it may not work that way, sources indicated.

The FBI has not actually said it would give up its file of multistate criminal offenders.

Feasibility Study

The Triple I proposal should be more palatable to Congress and to states that have objected to CCH costs and policies, according to William A. Bayse, assistant FBI director, Technical Services Division.

"We would like to get a viable criminal records program for the states," Bayse said. "We have a responsibility in that area. We are looking at this [Triple I] as an alternative to centralization."

The feasibility study which involves

only Florida, has "the full support" of Congress, added Lawler, who acknowledged that NCIC message-switching proposals had become "politically unacceptable."

A three-month pilot program is expected to start sometime this summer. The NCIC will be evaluating the effectiveness of the plan, the costs involved to the FBI and state governments and various managerial questions, such as who sets policy for the joint federal-state system and who guarantees privacy of the records, Lawler said.

In the meantime, Congress's Office of Technology Assessment (OTA) is expected to complete an in-depth study of NCIC by July. The Triple I

proposal is one aspect of NCIC operations under OTA investigation.

In addition, legislation now before Congress would direct the FBI to establish an independent study group to look at various options in NCIC operations.

But as Lawler noted, those are broader studies. The Triple I proposal is only directed at seeking the best system for the CCH program.

As seen by the FBI, the Triple I feasibility study fits in well with OTA study and the intent of the proposed legislation. All three, bureau officials noted, are efforts to end the 10-year CCH controversy.

Optimizing a production line is a trial and error process. Unfortunately, trial and error takes time and costs money.

But now we have found a way to cut down on the number of experimental runs.

It's a new software package — PCAP, the Process Characterization and Analysis Package — developed by Western Electric for its own use.

PCAP has already proved itself in dozens of Western Electric production lines and is written to be portable so that it can be used on various computers.

PCAP does statistical analysis and projections. From either production data or experimental data, PCAP analyzes the variables and indicates how to run a production line. It can help bring production closer to optimization with much less experimentation.

PCAP is available under license from Western Electric. If you can use PCAP "as is," without maintenance or support, just send in the coupon below to find out how to make PCAP work for you.

Automation Prescribed for Food Stamp Project

By Jake Kirchner

CW Washington Bureau
WASHINGTON, D.C. — A large dose of computerization has been prescribed by Congress for the Agriculture Department's financially ailing food stamp program.

The \$10-billion-a-year program has run out of money, and the Senate and House are turning to automation to reduce the program's administrative costs and control fraud and error in food stamp administration.

Under the plan now before Congress, the states, which administer the federally fi-

naned program, would be given incentives to further computerize their portions of the program. To control fraud, food stamp records would be matched by computer with Internal Revenue Service, Social Security Administration and state-level records to ensure that food stamp recipients meet the program's income requirements.

Hit hard by inflation and unexpected increases in the number of recipients, federal food stamp funds are expected to run out by the end of May—months before the end of the

fiscal year.

The Senate has already passed legislation raising the spending authorization of the program for the remainder of the fiscal year. Final action by the House ran into trouble because several general budgetary measures had to be passed before the food stamp program could be revitalized.

Earlier this month the House appropriated the additional \$2.5 billion needed to finance the program through the fall. Final approval for extending the food stamp program was expected.

May 15 was the deadline for acting on the program so funds would not be suspended.

Although numerous amendments to the food stamp bill were debated in the House, substantial bipartisan agreement assured acceptance of the computer matching and automation sections of the legislation.

Higher Federal Funding

In its consideration of the bill, the House Agriculture Committee determined that DP and information retrieval systems "promise to help to control program error and reduce program costs well beyond the investment incurred in installing and operating them." Noting economies gained by increased automation in the Medicaid and welfare programs, the committee said that in every state in which there was "a major error problem" in food stamp administration, "one significant aspect of the problem has often been an inadequate computer system."

To provide "substantial incentive" for states to increase computerization of food stamp programs, the legislation would provide for federal payment of 75% of state automation costs. Current federal administrative assistance is 50%.

The increased funding would cover "all costs involved in originally bringing [DP] equipment, services and systems to bear on the food stamp program" — all costs associated with planning, designing and installing DP systems.

The plan would be "a one-shot infusion of federal funds" and would not cover continuing DP costs for administering the food stamp program, which would still be eligible for the 50% federal reimbursement.

Plans for Efficiency

The House committee said \$25 million spent the first year for further state automation could lead to savings of several hundred million dollars. To make the program even more efficient, states would be

expected to make their DP systems compatible with Medicaid and welfare computer systems, which already extensively use computer matching to control duplicate or fraudulent payments to recipients.

To beef up the error and fraud control procedures, the committee recommended extending computer matching authority under the program beyond the Social Security and welfare records now available to food stamp administrators. Calling computer matching "the most effective means for reducing fraud," the committee advocated making available wage, benefit and other financial information held by the Social Security Administration, state agencies

and various federal agencies, including the Internal Revenue Service.

Wage and benefit records maintained by any federal agency would be available. Ideally, records on salary, retirement, welfare, unemployment, and veterans' benefits — all personal income data — could be checked to make sure food stamp applicants meet eligibility requirements.

Addressing "the concerns of privacy" raised by computer matching, the committee proposed a number of record-keeping, safeguard and disclosure requirements food stamp regulators would have to meet to perform the computer matching called for in the legislation.

California Computer Camp Open to 10- to 15-Year-Olds

SANTA BARBARA, Calif. — Young people between the ages of 10 and 15 can get a jump on the computer world and still enjoy the amenities of traditional summer camps by attending Computer Camp this summer.

The camp is nestled in the heart of Los Prietos National Forest near here and equipped with the latest personal microcomputers. According to a spokesman, there is one computer for every two campers.

Campers will program computers in Basic, play games with computers and see films describing computer functions.

Advanced campers can study floppy disks, color graphics, computer-generated speech and music, robots, computer

chess and programming languages such as Cobol, APL, RPG and Pascal.

When they're not working on computers, the campers will be able to participate in horseback riding, tennis, swimming and hiking.

Computer Camp will be held at Rancho Oso, a 310-acre summer camp, and will feature five two-week sessions running from June 22 through Aug. 30.

The tuition is \$795 per session. Discounts are available for multiple registrations per family and for stays longer than one session, the spokesman noted from Computer Camp, Inc., Suite G, 1235 Coast Village Road, Santa Barbara, Calif. 93108.

Leaving Interest Restrictions Behind

Citicorp Credit Card Center to Migrate West

By Tim Scannell
CW Staff

NEW YORK — Citicorp is moving its credit card operations — lock, stock and computers — west, but not because of any Horace Greeley-type urgings.

The parent company of this city's largest bank and the nation's leading credit card vendor is shifting its computerized charge card center to Pierre, S.D., to take advantage of unlimited interest rates in that state. Presently, New York puts an 18% per year cap on credit card charges and less if a consumer's debt is above a certain level.

Other reasons for Citicorp's move include cheaper telephone lines, less expensive real estate and an overall savings in general operating expenses in South Dakota compared with New York, according to a Citicorp spokesman.

What's more, enticed by these financial carrots, other banks may soon follow the credit card migration to west of the Mississippi, another bank spokesman said.

Details of Transfer

Although details of Citicorp's move are still sketchy, the transfer is expected to affect all of the company's 1,800 to 2,000 employees that operate the credit card branch in Huntington, L.I. This number includes all of the firm's credit card DP staff. Employees will be given the option to move with Citicorp or take a chance on being relocated somewhere within the firm's banking network, the spokesman added.

However, as part of the negotiations, Citicorp has already committed at least several hundred jobs to Pierre residents and does not know exactly how many New Yorkers will want to pull up stakes to move with the company. Close to 2,500 people — DP and non-DP — will be needed to staff the new credit card operations center, according to one report.

Since the Federal Reserve Board and the comptroller of the currency have yet to approve the move, Citicorp has not decided whether to use its present DP equipment at the new site or install different systems. Citicorp's DP operations here are supported by a variety of computers, primarily IBM 3031 and 3032 mainframes.

Final system and staffing decisions will be made following the Federal Reserve Board's approval, expected to

come sometime in July. Citicorp hopes to have its credit card operations set up by the end of this year and running at full steam by mid-1981.

Citicorp has close to six million Mastercard and Visa credit cards outstanding, with around 80% of them held by individuals living outside New York state.

Chase Manhattan

Another bank concerned with New York's low usury ceiling and feeble credit card profits is the Chase Manhattan, considered to be this city's second largest bank.

Although Chase Manhattan does not have any plans to relocate its credit

card computers and staff, a future shift to a state like South Dakota is one of the options currently under consideration. However, there are a few important differences between Chase's computerized credit operations and Citicorp's. For example, while Citicorp maintains a dedicated bank of computers that focus primarily on tracking credit card transactions, Chase's IBM and Digital Equipment Corp. shop is used for across-the-board banking activities.

Since Chase's DP equipment is not on a one-to-one basis with its charge card applications, the company could not just close up its entire operations and plant its roots in another state, the

Chase spokesman noted.

If Chase were to relocate its charge card operations sometime in the future, it would most probably set up a dedicated site out of state that would not severely impact the firm's present DP shop and staff, he explained.

At least one thing is certain, however: interest ceilings restricted to 18% and under make it virtually impossible for any bank's credit card operations to turn a profit, the Citicorp spokesman observed. In fact, for the first time in history the credit card industry as a whole is actually losing money, making it more attractive for banks to relocate to less interest-restrictive states.

Win 80Mbytes and a San Francisco weekend.

Enter System Industries' DISK-covery Sweepstakes, and you and a companion can win round-trip airline tickets to San Francisco from anywhere in the world. The prize also includes a weekend stay at the elegant Mark Hopkins Hotel, with meals included.

To top off your weekend, we'll also give you a System Industries 80Mbyte disk storage drive. Either DEC or Data General compatible. Our 80 Mbyte system delivers the same performance as DEC's \$25,000 RMOX or a Data General Zebra, but it's priced at only \$14,000.

And we're also giving away 10 great second prizes — beautifully styled digital watches with chronograph and alarm from a well-known manufacturer.

Even if you don't win the DISK-covery Sweepstakes, you still can't lose. We'll send you full details showing how you can save money by buying from System Industries, the world's largest independent disk storage system manufacturer. The deadline for entries is July 4, 1980.

System Industries

ENTRY FORM

System Industries, 525 Oakmead Parkway, P.O. Box 9025, Sunnyvale, CA 94066, USA
Telephone: (408) 732-1850 Telex: 346-459

CW526

(Sweepstakes is limited to those actively engaged in the purchase, recommendation or specification of disk storage for DEC or Data General minicomputers)

Name _____ Title _____ Company _____

Division _____ Address _____ MS _____

City _____ State _____ Zip _____ Phone _____

Please answer the following questions to be eligible to win:

1. We have ☐ DEC ☐ Data General minicomputers on site.
2. We use ☐ DEC ☐ Data General ☐ System Industries ☐ Other _____ disk storage systems.
3. If I win the 80Mbyte drive, I will use it for _____

4. Even if I don't win, I'd like you to rush full details about System Industries product line. ☐ Yes ☐ No
5. I want to know how I can cut storage costs with System Industries. Please have a salesman call today. ☐ Yes ☐ No

Contest is void where prohibited by law. Entrants must be over 21 years of age and actively involved in the use, purchase, recommendation or specification of minicomputer/peripherals. All System Industries' employees, distributors, advertising agencies and their families are ineligible to enter. The winning entries will be judged by random selection, and will become the exclusive property of System Industries. Only one entry per person will be accepted. No purchase is required to win. A photocopy of this entry form will be accepted as valid. System Industries reserves the right to substitute prizes of comparable value should circumstances require. The winners agree to hold harmless System Industries, its employees and agents from any liability arising from the use of the prizes.

Panalists Point Out Obstacles In Merger of DP, WP Technologies

By Bruce Hoard

CW Staff

WOBURN, Mass. — The merger of word and data processing technologies is close to becoming a reality, but still faces considerable obstacles, panel members at the Expo '80 Conference and Exposition agreed here recently.

Similarities between WP and DP are growing; today, WP equipment can calculate, sort and produce heavily formatted reports, Charles I. Norris, manager of the automated Business Communications Program at International Data Corp. (IDC), pointed out.

However, in the area of communications, users have had difficulties in transmitting data and text traffic on the same communications link in the past, he noted, adding that the development of electronic mail and compatible protocols are evidence of progress.

Underlining that point, Norris said, "DP and WP have parallel missions to represent information when and where it is needed."

Some of the problems hampering a WP-DP merger at the present time include excessive WP drain on CPU storage and the unwillingness of end users to acclimate themselves to the increased operational demands it would place on them,

Norris said.

The merger of WP and DP also carries ominous political overtones, Norris pointed out. The issue of centralized control could bring about a "Mexican standoff" between DP and office administration departments.

User Views

Citing an IDC study of 25 Fortune 500 companies with distributed data processing systems, Norris noted that users rated data entry highly important, while WP was not yet considered important.

Nonetheless, users see WP playing an important role in the future, and small companies especially will experience the DP-WP overlap that could result in mergers, he said.

Willoughby Walsche, executive editor of *Word Processing Systems Magazine*, said DP and WP personnel "live in two different worlds. One doesn't talk to the other and when they do, it's in different languages."

DP is production-oriented while WP can be suited to the needs of the individual user, Walsche added. Moreover, DP is more complex and requires operating systems and programming while WP frequently uses turnkey systems.

Common Features

Despite their differences, the two technologies are slowly drifting together and currently share several commonalities, Walsche continued.

DP, WP and data communications all use CRTs, storage media and peripherals such as printers, making it "ridiculous" not to combine their duties, she added.

Like Norris, she noted how WP equipment is duplicating formerly proprietary DP roles, such as math and sorting, through the use of application programs.

"If the two technologies are to be merged, WP equipment must be expandable so storage and peripherals can be added," she said, adding that the equipment must also support software packages.

Duplication of Efforts

Consultant Norman M. Martin decried the duplication of WP efforts and said a person operating a typewriter should never have to pass copy on to a teletype operator for rekeying unless the message is nondomestic.

There are three ways to reach the "office of the future" that everybody's talking about, Martin said. They include the use of compatible communications, peripheral devices and "black boxes."

Both DP and WP equipment must accept digital communi-

cations, and even then there will be linkage problems, Martin said, adding that text editing equipment may use asynchronous protocols while a computer program may be synchronous.

One peripheral bridging the DP-WP gap is the optical character recognition (OCR) reader, which merges WP applications with number crunching, according to Martin. Magnetic card units can also share in the DP environment by being connected to shared logic and reading cards in the host system, he said.

Microprocessor-based black boxes can help to compensate for the lack of communications ports on WP equipment by duplicating their functions, Norris said.

Meet to Cover Model Acceptance

LA JOLLA, Calif. — The Society for Computer Simulation (SCS) will hold a conference and workshop on the topic of "Model Acceptance" Sept. 3-5 in Washington, D.C., at the Cannon House Office Building.

The workshop will bring together an international team of speakers to address the issue of "how computer modeling activities can better serve nations and societies through wider acceptance and understanding by those in power," according to John McLeod, co-organizer of the event.

More information on the meet is available from McLeod at the SCS, P.O. Box 2228, La Jolla, Calif. 92038.

Master of Software Engineering at the Wang Institute.

The Wang Institute in Tyngsboro, Massachusetts, is an independent, non-profit educational organization which offers college graduates a unique opportunity for a Masters degree in software engineering.

The Institute is equipped with VAX 11/780, Prime 750, and Wang VS computers on site, with remote access to an IBM 3033. Every student will have his or her own terminal in a laboratory office.

Every member of the Institute faculty has background in both academia and industry. And our high faculty/student ratio ensures strong personal interaction within the learning environment.

FAA Contracts to Develop Collision Avoidance Units

By Marguerite Zientara

CW Staff

WASHINGTON, D.C. — The Federal Aviation Administration (FAA) has awarded a \$750,000 contract to Textron, Inc.'s Dalmio Victor Division of Belmont, Calif., for development and testing of three prototype microprocessor-based airborne collision avoidance systems (CAS).

The contract calls for delivery of the three units — two operational and one spare — in the spring of 1981. They will then be installed in agency and airline aircraft for a year-long test and evaluation program designed to prove the feasibility of the equipment in actual operations.

Currently negotiating with several airlines for the project, the FAA estimates that production models of the equipment could be commercially available in 1983.

Active System

Dalmio Victor's Active Beacon Collision Avoidance System (BCAS) works in conjunction with the transponder/altitude encoder already installed in an estimated 200,000 private and commercial U.S. aircraft, according to an FAA spokesman.

Normally, the transponder/altitude encoder in an aircraft is triggered by ground-based radar, which then sends a signal through air traffic control computers to tell controllers each aircraft's identity, ground speed and altitude.

The airborne Active BCAS system will also be able to trigger the transponders, "listen" to the replies, sort out those that present a potential hazard and alert the pilot to any problem, the spokesman said.

The system can advise a pilot of the range, altitude and bearing of any threatening aircraft and can issue climb or dive instructions to a pilot in the case of a potentially dangerous situation, he added.

Along with the good points of an active system are some disadvantages, according to the spokesman. The active system does not have left/right evasive action instructions; it "broadcasts" in order to find where aircraft are, thereby degrading the radio frequency environment in high-density air traffic areas, the spokesman acknowledged.

Such drawbacks have been cited by Litchford Electronics, Inc. of Northport, N.Y. — developers of a microprocessor-based Passive BCAS that is currently being studied by the National Aeronautics and Space Administration.

Three-Pronged Program

The FAA, however, believes the passive Litchford system would not be effective in such a test situation and is continuing research on its active system as part of a three-pronged program.

That program includes the Automatic Traffic Advisory and Resolution Service (Atars) in conjunction with the FAA's ground-based Discrete Address Beacon System (Dabs), which would connect the ground air traffic control system and other data sources to aircraft via an automatic data link.

The FAA's research program also includes two BCAS programs, the spokesman said. The Active BCAS program consists of work being done mainly at the Massachusetts Institute of Technology, Lincoln Laboratories and now Dalmio Victor, he explained.

Thirdly, there is a Full-Capability BCAS development program — an extension of the Litchford concept, according to the FAA spokesman — wherein "a whole range of subcontractors" are doing individual studies and experiments for the FAA.

The Full-Capability system would probably not be available until "perhaps the 1986 time frame."

TP-232
MODEM
SIMULATOR

The TP-232 Modem Simulator replaces a pair of modems in local, in-house applications, as shown below. With its wide variety of strap selectable options, this unit is a versatile tool for system check-out as well as an economical replacement for a modem pair.

FEATURES

- Replaces any modem pair
- Synchronous or asynchronous operation
- Selectable data rates through 19,000 bps
- May be used in continuous carrier or polling systems
- L & D status indicators
- Available in rack mount and stand-alone configurations
- Regenerates EIA signals allowing greater cable lengths
- RS-232 C compatible
- Digital data loopback

Boost programmer productivity up to 75%.

General Automation introduces InstaCode™ Hardware and NoCode™ Software.

Now there's a way for you to write application programs without time consuming coding.

NoCode software eliminates complicated program languages. Instead, you log all computer input on simple specification sheets. Then enter the data directly into the system.

It's so simple, even non-programming people can use it. It can reduce application development time up to 75%.

A compatible hardware family.

That's InstaCode. A family of

systems based on Solution Series™ processors that give you total peripheral and controller compatibility. Total software portability. Batch or on-line processing. Plus micro to mini based capabilities.

InstaCode systems range from 128K bytes to 2 MB of main memory. As your needs increase, you can easily upgrade your system by adding more memory or a more powerful CPU while utilizing all of your current peripherals and software.

There's also a choice of data storage capabilities. Like a high-speed 80/300 MB Disk Storage Module with a formatter, that allows you to control up to eight drives, with 2400 MB of combined data storage. Or a Cartridge Disk System with 10 to 40 MB on-line capacity.

For complete details on InstaCode and NoCode, write for our brochure. General Automation Inc., 1055 South East Street, Anaheim, CA 92805. Telephone: (714) 778-4800. TWX: 910-591-1695.

How Structured Are You?

Have you come up with a method for determining how structured methodology is working at your DP installation?

Let our readers know which techniques you've used — be it GOTO-less code, Hipo diagrams, restrictions on program length or design and program logic walkthroughs. If you're happy with them, we want to know why; if you've found them to be unworkable in your environment we'd like to know the reasons for that too.

Send replies to The Editor, Computerworld, 375 Cochituate Road, Rte. 30, Framingham, Mass. 01701.

Summer Institute to Cover Cobol

SAN FRANCISCO — Golden Gate University here is offering a Summer Institute focusing on structured Cobol programming techniques as most commonly applied to IBM systems in a business environment.

Designed for those with little or no prior programming experience, the program includes eight seminars consisting of four three-hour instructional sessions with a two-hour workshop following each session.

Topics include "DP Basics," "Introduction to Structured Cobol," "Applied Fundamentals of Cobol Programming," "Introduction to 360 and 370 JCL," "Sequential File Application," "Table-Handling Techniques," "Non-sequential File-Accessing Techniques" and "Cobol Sort and Report

Writer."

The \$1,600 fee for the two-month institute includes books, computer time and instructional materials. Further in-

formation can be obtained from Golden Gate University's Information Science Department, 536 Mission St., San Francisco, Calif. 94105.

Seminar to Review Ada

LANHAM, Md. — A one-day seminar reviewing Ada, the standard language which will be used for future Department of Defense embedded computer software, will be held at the Ramada Inn here June 25 from 9 a.m. to 4:30 p.m.

The featured speaker at the seminar, sponsored by the Association of Computer Programmers and Analysts, (Acpa), will be Dr. David A. Fisher, who will discuss the impact of Ada

language development on the software industry. Fisher is a staff specialist for computers, communications and command and control for the Office of the Undersecretary of Defense for research and engineering.

Fees are \$120 for Acpa members and \$140 for nonmembers, with \$20 being applicable to Acpa annual membership. Additional information is available from Acpa at 294 Main St., E. Greenwich, R.I. 02818.

New way to exert more control.

Now you can get business graphics in a simple, smart display terminal.

Regent 30, the newest terminal from ADDS, offers a full upper and lower case display and keyboard, cursor control and editing keys, and transmission capability by character, line, or page.

Our patented business graphics let you make bar charts, graphs, histograms—provide a resolution of over 11,500 graphic elements to depict financial or other data.

And with all this extra visual control, the *Regent* 30 is priced so you can control costs.

For more information and the name of your nearest distributor write: Displays Division, Applied Digital Data Systems Inc., 100 Marcus Blvd., Hauppauge, N.Y. 11787. Or call (516) 231-5400.

Threat to Centralized Organizations

Business Exec Issues Alarm on Data Flow Laws

By Phil Hirsch

CW Washington Bureau

DETROIT — Foreign data protection laws restricting the kinds of information that can be transmitted to DP centers in other countries pose a growing threat to U.S. companies operating overseas, the vice-president of one such company said here recently.

The threat is particularly serious for companies with centralized management organizations, according to John Kendle of Cleveland's Eaton Corp. Addressing a technical session at the International Communications Association annual meeting, Kendle said that if present trends continue, his company's direct costs will increase \$80,000 a month in West Germany alone. The money will have to be invested in computers and support to do work now performed by an Eaton DP center in England.

Germany has enacted a law, he explained, that bars transmission of payroll and other employee records across its borders beginning in 1982.

Clear Direction

Such laws are particularly threatening to centrally managed companies, Kendle pointed out, because centralization required a continuous flow of detailed financial, sales and production accounting information from the branches to headquarters. This is precisely what the laws are attempting to limit.

So far, he added, the impact has been softened because the laws on the books are being modified somewhat by their administrators in most countries, and many of the most burdensome proposals have not yet been enacted.

But Kendle emphasized that the direction is clear — it's toward more and tighter regulation. As he put it, the bigger danger is not "Big Brother" but "Big Reggie" — a set of government regulations that cover nonsensitive business data as well as sensitive personal information. Eaton Corp. — a worldwide manufacturer and marketer of truck components and appliance controls — believes strongly in the need to protect personal privacy, he emphasized.

One likely result of data protection regulation is that centralized companies like Eaton will be forced to restructure their management organizations, Kendle said, because the restrictions will make centralized management impossible.

He appeared to be particularly concerned about proposals in several European countries to classify business firms as "legal persons." Legislation

now under consideration would make the accounts receivable, prospect lists and other proprietary files of such "persons" subject to government inspection without advance notice.

Get Involved

Kendle urged computer and communications systems managers to get involved in the data protection battle by alerting their top company executives and legislators to the threat. Lawyers, academics and government officials have been the principal participants so far, he said.

The lack of participation by business people, particularly those with computer and communications expertise,

is especially serious because only this group has the technical expertise needed to understand many of the implications of data protection regulations.

Era of Protectionism

Another speaker at the same session — attorney John Eger — said that while much has been written and said about the "information society" and its importance to the U.S. domestic and international economic future, the accompanying "politicization of technology" is seldom appreciated.

"We are heading for an era of protectionism the likes of which have never been seen," said Eger, who was the

President's chief telecommunications adviser in the Nixon and Ford Administrations. Restrictions on the flow of data across international borders will be a common protectionist tactic of other countries, he contended.

According to Eger, a recent statement by Louis Joinet, author of the French privacy protection law, accurately reflects a prevailing attitude in many countries.

Basically, Joinet said that information is power and economic information is economic power; a country which loses control over the storage and processing of its data loses sovereignty as a result.

OUR NEW BUSINESS COMPUTER SYSTEM IS AS VERSATILE AS A SWISS ARMY KNIFE.

Please join us in New York on June 11/12 and judge for yourself!

Quite simply, this new ME29 multi-purpose computer contains everything today's user is looking for in a single compact system. It is equally at home as a free-standing data processing system or in a distributed processing network, and it is equally well-equipped to meet the needs of the d.p. professional and the busy line manager.

Quite apart from its day-to-day data processing power, the ICL ME29 offers:

- integrated word processing
- electronic mailing
- private viewdata facilities

It can be relied upon to increase your office productivity and speed your internal communications, as well as provide the answer to all your information processing requirements.

Prices, too, are geared to meet the price/performance demands of management in the 80's. We can confidently claim that never before was so much information processing capability made available in such a concentrated size at such a competitive price.

ICL, one of the world's leading computer manufacturers, is now introducing ME29 into the United States. Find out why this new computer is proving such a success worldwide and how it can help solve your data processing needs, by attending the U.S. (East Coast) introduction of ME29 on either June 11th or June 12th at the New York Hilton, New York City. Just complete the coupon and mail it to us before June 5th as space is limited. We look forward to meeting you.

ICL ME29

Please reserve a seat for me at the ME29 introduction:

Boston Women DPers Meeting on Thursday

BOSTON — The recently formed Greater Boston Chapter of the Association for Women in Computing will hold a meeting May 29 at the Shawmut Bank here.

Robert L. Brown, president of Conec Co., is scheduled to speak on "Managing Your Career." The meeting opens informally at 6:30 p.m., with official business starting at 7 p.m.

The meeting will take place on the eighth floor of Shawmut Bank, located at 1 Federal St. in downtown Boston.

On System Design Methodologies

Q In response to a March 31 "Turnaround Time" question concerning system design methodologies, I submit the following response:

We use a modified version of Arthur Andersen's Systems Development Methodology. We installed it in late 1978 and are only now seeing some positive results.

Reluctance to use a structured design methodology was very strong and still remains fairly high because a structured approach does tend to take longer. Adapting to a structured design methodology has been more painful to our management people than for our system analysts because of the extended time required to produce the finished system project.

We are slowly beginning to realize that the benefits derived from implementing a system that follows structured design methodology far outweigh the time saved by using a "seat-of-the-pants" approach. In our situation, implementing a methodology has been like breeding elephants:

- All work takes place on a high level.
- It is accomplished with a great deal of shouting and screaming.
- And it takes about two years to see the end results.

A What more can I say?

Q I'm responding to the request in "Turnaround Time" for information relative to installation of a systems development methodology. My experience is with Spectrum International, Inc.'s Spectrum-1.

All other things being equal, smaller DP organizations can and do implement faster than larger ones. DP organizations with 25 to 50 analysts and programmers typically get Spectrum-1 installed in nine to 12 months. Very large DP organizations (more than 200 analysts and programmers) may never get fully implemented according to my definition (see below). Again, great benefits may be gained from the "journey" to install the methodology. The problem is, they just never get to the

destination.

Installing a methodology is not a technical challenge, it is a social one; we are asking people to change the way they do things. These people (particularly analysts) tend to view themselves as instruments of change, rather than objects of it.

Organizations that treated Spectrum-1 implementations as a formal project have accomplished the implementation in shorter time and with higher success.

This means having a project leader, a well-defined and documented project plan and regular and meaningful project reviews.

I don't believe you can say that implementation of a methodology is complete until all of the following have been accomplished:

- Management has issued and intends to enforce a set of policies which are consistent with the methodology.
- Management has budgeted for the administrative resources needed to support continued success of the methodology.
- User managers set the priorities for projects and DP is out of the "priority-setting business."
- Users are committed to the projects and accept their roles as project sponsors and quality reviewers.
- Pilot projects with regular quality review are well along in following the methodology and all new projects will be started under the methodology.
- The staff has been trained.
- The methodology has been customized to suit the local environment and a sufficient quantity of manuals and forms are available.
- The documentation turnover process — to users, operations and systems — is functionally smooth.
- Updating of documentation on older but volatile systems is under way.
- Project team members are regularly reporting their time utilization and their progress.
- Regular project status reports are issued by project managers.

A Performance measures should be established in order to evaluate the effectiveness of a project to implement a system development methodology.

Your list of performance measures is well conceived and surely will be helpful to many DP managers who have implemented or are considering implementing a methodology.

Have a question? Send it to Larry Long, Editorial Department, Computerworld, 375 Cochituate Road, Rt. 30, Framingham, Mass. 01701.

Long is a professor at Lehigh University, a DP consultant and author.

On June 30th, Computerworld will show you how to evaluate and choose systems and utility software packages.

**Don't miss this Computerworld
Special Report, Systems and Utility
Software—Ad close is June 13th.**

With the ever-expanding number of software packages available, finding the best one for your needs can be confusing.

In this Special Report, edited by Marcy Rosenberg, we'll answer the important questions for selecting software such as:

- How to evaluate the various types of systems and utility packages.
- How to choose a supplier.
- When to stick with software supplied by the hardware vendor—and when to turn to independent software developers.

You'll also read accounts of user experiences, tutorial essays, the legal aspects to consider when negotiating contracts with vendors, reviews of current products and speculations about future trends.

If you're an MIS executive, DP manager, Supervisor or Programmer, you'll find our June 30th report especially valuable. If you market systems or utility software—your ad should be there. Don't forget, ads must be received by June 13th. To reserve space, call your Computerworld sales representative or Frank Collins at (617) 879-0700.

Doing it on Kodak film costs less.

An impact printer can chew up an awful lot of paper. Trouble is, the paper it chews up is costing you more and more every year.

This year, you can expect to pay about \$29.00* per 1000 pages of 3-part computer paper, 56% more than you paid two years ago.

With the price of paper climbing higher and higher, consider the advantages of owning a Kodak Komstar microimage processor. This dry laser printer doesn't use *any* paper. It prints on microfilm, instead. Rather than spending \$29.00 to print a 1000-page, 3-part report, you'll spend only about \$1.00, the price of 9 microfiche.†

A Kodak laser printer works on-line *or* off-line. It's 6-8 times faster than an impact printer, which means you can save more on time and labor. It takes 50 minutes to decollate, burst, bind, and package a 1000-page report against only 9 minutes to print, duplicate, and package the same report on microfiche.

If savings like these interest you, send us the coupon for more information. Or ask your Kodak representative for a demonstration of Kodak Komstar microimage processors.

Better make up your mind soon, though. Before the next increase in paper prices does it for you.

*Prices vary with geographic location and grade of paper purchased.
†Includes one original set and two duplicate sets.

Kodak Komstar microimage processors.

Today's interactive data processing system from Four-Phase.

It's the best way to store COBOL and word processing for tomorrow.

One system does the work of several with our powerful Multifunction Executive.

The MFE/IV™ Multifunction Executive system from Four-Phase is source data capture with a future. It's the economical system that will meet your distributed data processing and 3270 central inquiry requirements, and it's available right now.

Then, as soon as your needs dictate, the Multifunction Executive system lets you combine distributed data processing, standalone COBOL processing, word processing and program development tools to suit the changing job requirements of users at clusters of remote displays. All the primary office computing functions. All on one system. All at once.

Easy to install and use.

MFE/IV systems are up and running in weeks with field-proven hardware and software packages that you control but don't have to develop. Optional prompting from job definition through formatting reduces training time and simplifies operations.

IBM-compatible communications.

Your MFE/IV system is supported by IBM-compatible interactive and batch communications today and with SNA and SDLC whenever you're ready. Four-Phase provides nationwide service and software support.

Ask for a demonstration.

Let us show you how to get The Multifunction Edge. For a personal demonstration, return the coupon below or call your nearby Four-Phase Systems office. Also available through Four-Phase Systems, Ltd. in Canada and distributors throughout the world.

Yes, tell me more about **The Multifunction Edge**.

☐ Please arrange a demonstration.

☐ Please send information.

A computer and office systems conference and expo that really pays off.

Check it out. It will be in your city soon.

It's the unique opportunity you've been waiting for. A chance to see and hear about the latest computer and office systems products. Without flying to a DP convention halfway across the country.

It's the Expo '80 Conference & Exposition, bringing the very latest information, equipment and professional expertise to you: at the Detroit Renaissance Center, the Chicago Apparel Mart Expo Center and the Cincinnati Convention-Exposition Center.

Join us at one or more of the 3 days of conferences and also see equipment from industry leaders like Basic Four, Burroughs/Redacron, Dictaphone, Hewlett-Packard, Prime, Savin, Sperry Univac, Lanier, T.I., Hazeltine, and Wordstream, to name a few.

Check out our Detroit conference schedule:

June 3rd Conference (Exhibit hours: 10:00-5:00)

D-1 8:45-10:00 EXECUTIVE BRIEFING: INFORMATION SYSTEMS PLANNING John Lusa, Editor, *Infosystems Magazine* will make this keynote presentation. He will be joined by a panel of Detroit area EDP executives who will discuss specific cost and productivity improvements they have for 1980/81. Speakers will include Charles H. Fitts, Director of MIS Budd Co., and Carol Gordon, Corporate Systems Manager, Federal Mogul Bearings.

D-2 10:00-11:00 IMPROVING DATA ENTRY PERSONNEL PRODUCTIVITY Wilhelm Kast, President of Datapro Corporation in Southfield, will give you a user viewpoint on data entry productivity.

O-1 11:30-12:30 HOW WORD PROCESSING CAN BREAK THE OFFICE PAPERWORK BOTTLENECK Karen H. Elder, Partner at Central Word Processing Systems, will review the proper combination of people and machines as the key to successful implementation of the automated office.

O-2 11:45-12:45 HOW TO CUT COMMUNICATION COSTS Frank K. Griesinger, President of Frank K. Griesinger Associates in Cleveland, will make this presentation and tell you how to get more for your voice/datacom budget.

M-1 1:30-2:30 AUTOMATION FOR PLANT PRODUCTION AND TESTING APPLICATIONS

F-1 1:30-2:30 SPECIAL PRESENTATION OF MICRO-GRAPHICS APPLICATIONS Special micrographics and microfilm session will be given in conjunction with the National Micrographics Association.

D-3 3:30-4:30 COMPUTER GRAPHICS: NEW WAYS TO VISUALIZE COMPUTER INFORMATION FOR BUSINESS, ENGINEERING AND RESEARCH USERS

M-2 3:30-4:30 OPTIMIZE MANUFACTURING PRODUCTIVITY VIA SMALL AND LARGE COMPUTER APPLICATIONS

June 4th Conference (Exhibit hours: 10:00-7:30)

O-3 8:45-9:45 COMBINED WORD AND DATA PROCESSING Paul Lowey of Kelly Services and Ronald Reume, President of Resource Data Corporation, will cover the hardware and people obstacles of integrating word and data processing systems.

D-4 10:00-11:00 DATA BASE OPPORTUNITIES IN CENTRALIZED AND DISTRIBUTED SYSTEMS Dr. Robert H. Holland, President of Database Design in Ann Arbor will discuss data base design and applications as key to both centralized and distributed systems.

D-5 11:30-12:30 DISTRIBUTED PROCESSING: USER OPPORTUNITIES IN NETWORK SYSTEMS Dr. Dixon Doll, President of DMW Group, will present a major speech on advanced distributed processing.

D-6 1:30-2:30 FINANCIAL AND MANAGEMENT TECHNIQUES USING EDP TOOLS Dr. Gordon Duke, Professor at Michigan State Graduate School of Business and Barry Frankel, Applied Data Research, will speak.

D-7 3:30-4:30 SMALL AND DESKTOP COMPUTERS FOR BUSINESS AND PROFESSIONAL APPLICATIONS A panel of experienced Detroit area users will tell how they are using personal and microcomputers.

O-4 3:30-4:30 LINKING WORD PROCESSING AND PHOTOTYPESETTING TO CUT REPROGRAPHICS COSTS William D. Green, Accounts Manager at Alphatext and ten-year veteran in data processing and automatic publishing, will give an overview.

June 5th Conference (Exhibit hours: 10:00-5:00)

D-8 8:45-9:45 DISTRIBUTED PROCESSING APPLICATIONS IN DISTRIBUTION-ORIENTED BUSINESS Anne Smyth, Chicago Regional Manager, Distribution Management Systems, will discuss the use of DDP for controlling inventory, order entry and shipping manufacturing, consumer goods and retail distribution.

O-5 10:00-11:00 HOW TO USE COMPUTERIZED TELEPHONE SYSTEMS Albert S. Levenson, President of Detroit Communications Corporation, will speak.

O-6 11:30-12:30 INTEGRATED INFORMATION SYSTEMS Dr. James Carlisle, President of Office of the Future, Inc. will describe how integrated information systems can improve executive and professional productivity by unifying text data bases with important "spinoffs" in electronic mail and teleconferencing.

D-9 11:30-12:30 SELECTING A SMALL BUSINESS COMPUTER: HARDWARE & SOFTWARE Lawrence Feidelman, President of Management Information Corporation and editor of *Small Business Computer News* and *Packaged Software Reports* will make this presentation.

S-1 1:30-2:30 ENHANCING MANAGERIAL/PROFESSIONAL PRODUCTIVITY FOR END USERS Robert M. Howe, V.P., Booz-Allen & Hamilton.

There's more after Detroit.

Call the 800 number for details about the specific speakers and topics in your city.

Chicago Apparel Mart Expo Center June 10-12
Cincinnati Convention-Exposition Center June 17-19
Admission to the three day Conference Program and Exhibition is \$25 - or pre-register and save \$5. Call 800-343-6200. In Massachusetts, call 617-964-4550.

Now in Detroit at the Renaissance Center.

EDITORIAL

Backward Is Better

The National Computer Conference is great — but it's just too big.

With 600 exhibiting companies occupying 1,600 booths spread over six convention facilities in Anaheim last week, only the most robust could possibly take in all the exhibits and attend the wide-ranging technical sessions.

But the organization was superb — even with the largest crowd ever for a show here, lines were almost nonexistent at the registration area, the crowd flowed smoothly and, except for a few hot spots, the air conditioning held up.

NCC is clearly the gathering of the clans — the largest grouping of computer people from around the world each year. It is the county fair of the computer industry, full of hoopla and old friends meeting to discuss old times as well as the present.

Once a year is not enough, since the computer industry has grown into one of the largest in the world and the crowds overwhelm any convention facility. Several suggestions come to mind for splitting the show into different parts: perhaps one OEM show and one end-user show.

But we would propose a bold step backward. Back to the days of East and West Coast shows, one in the fall and one in the spring. All through its early history, the American Federation of Information Processing Societies (Afips), sponsor of the event, operated this way with the Fall Joint Computer Conference and the Spring Joint Computer Conference — and they worked well until trapped by the recession of 1970-1971.

While the National Computer Conference is truly national — and increasingly international — the vast majority of the attendees still come from the local region. An NCC in Anaheim has a very southern Californian feeling, while one in New York City is definitely East Coast in feel.

By splitting the show on a geographic basis, Afips could give everyone in the industry a chance to attend. In addition, each of the resulting shows would probably be a bit smaller, cutting down on the congestion and hassles that go with the NCC as it is now.

Although we usually urge progressive reforms in the industry, sometimes backward is better. Afips would do the entire industry a favor by taking a massive step backward to the late 1960s and earlier, when it sponsored two shows a year.

DATA PAST

Five Years Ago May 28, 1975

NEW YORK — The long-awaited U.S. vs. IBM antitrust trial began here at the U.S. district court. The Justice Department's legal team delivered the opening statement, which dealt with the so-called "old issues" in the case — charges that "IBM monopolized and intended to monopolize the general-purpose electronic digital computer systems market." The government's amended complaint also charged that IBM monopolized and intended to monopolize the related peripherals and leasing markets.

ANAHEIM, Calif. — The Control Data Corp. 38500 mass storage system made its debut at the National Computer Conference here. With media said to be similar to but not compatible with IBM's 3850, the CDC storage mechanism promised to give users of IBM 370/145s and up another choice for mass storage.

Eight Years Ago May 24, 1972

ATLANTIC CITY, N.J. — The close of the Spring Joint Computer Conference (JCC) here signaled the end of an era, according to the show's sponsor, the American Federation of Information Processing Societies (Afips). In reaction to the declining number of exhibitors at the spring and fall JCCs held alternately in eastern and western U.S. convention centers, Afips considered holding just one national show per year in greater population centers.

ATLANTIC CITY, N.J. — IBM embarked on a \$40 million, five-year project to develop data security options "as near as we can come to the limit of the art" and to make these options available to large users. IBM Chairman T. Vincent Learson told the Spring Joint Computer Conference here that "three highly qualified user installations" and a fourth at IBM would be used to "build a sound body of knowledge and develop some hands-on experience."

LETTERS

IBM Upkeep Costs

It is absurd to suggest that falling quality of maintenance would be a prime reason for increased IBM maintenance costs [CW, May 12]. Let me suggest some other reasons:

First, the rise of large terminal-based networks, whose proper functioning is vital to many businesses, has increased the demand for quality and promptness of maintenance service. These increased performance demands exact their price. It would be hard for IBM to sell some of these systems without assuring prospective buyers of such service.

Second, excessive concern has been fostered with the purchase: rental ratio as a guideline to buyers. Responsible for this shallow view of the computer business have been not only IBM's own sales force, but most computer journalists and security analysts specializing in computer stocks. As a result, the gradual shift of IBM's revenue stream from purchase price to maintenance charges has gone largely unperceived.

Ironically, most IBM salesmen are quite unaware that their own commissions, which are based on points, are now a smaller percentage of the total IBM revenue stream from a product than before.

Harry Nagler

New York, N.Y.

DP Accreditation

I feel compelled to respond to Stan Kupiec's letter "Your Own Gold Mine" [CW, May 5]. He brought up some good points regarding the programming talent available, but I think some discussion is called for.

In the first place, I would sure like to have a list of technical schools around the country that produce highly trained DP people. Unfortunately, many of the schools are out-and-out frauds that simply exist to make money at the ex-

pense of their misinformed students and government agencies that provide student grants.

I have recently had a very personal involvement in this problem, since a member of my family is attending a computer operations course at a New Jersey technical school. After three months, she still has not learned any operations and, in fact, had to ask "What does a disk pack look like?" during a recent "off-site" tour of a computer installation.

Both programming and operations instructors are recent graduates of the courses themselves and have no qualifications to teach (much less program). The instruction the students do receive is relevant to the DP industry in 1970.

Unfortunately, I have heard the same problems exist in many of these so-called schools. Kupiec was lucky to find a reputable school, and his company may do very well by tapping the resources from it.

I only wish that either the DP industry itself, or the state governments, would clean up this mess, so firms such as ours would feel comfortable with these graduates. One additional problem that arises in training your own programmers is lack of time. Many companies have the personnel free to spend on this training, while many others will pay the premium of an experienced programmer who will "hopefully" require little supervision. Other than the problems that I mentioned, Kupiec made a lot of sense.

There are good, eager, bright people available from many of these schools, but with the present conditions in the DP education industry, it is very much like Russian roulette. Perhaps other readers feel the way I do, and a forum could be started in *Computerworld* that might lead to Data Processing Management Association (DPMA) accreditation (or something similar) in the future.

SOCIOLOGY OF COMPUTING/Robert L. Glass

May I Have an Act Of God, Please?

It's not often you get to stand up for your rights and please a manager at the same time. But Bobbie Chutzpah managed to do it. In fact, her manager, Malcolm Overkill, may remember this incident as one of his all-time computing experience highs.

Project Sched had been in trouble from the very beginning. It had been oversold and underestimated, and behind it lay a trail of broken digital promises.

When Bobbie joined the team, Sched was well in over its head schedule-wise, and Malcolm was in the corporate doghouse.

Now it came to pass, in the manner of a football coach after a losing season, that Malcolm was placed on a management push-down stack, and a fire-breathing troubleshooter named Rumley Powerplay was brought in above him to clean up Sched's act. Rumley had no emotional investment in the success or failure of Sched. His goal was purely to get the job done. Singlemindedly, he set about it.

For his first take-charge act, Rumley set up a series of interviews with the individual members of the technical team. He wanted to find out their overall understanding, and he wanted to find out their specific status. To show that his was a no-nonsense approach, he scheduled these meetings for the upcoming Saturday. Sched's programmers, shocked to the core at this cavalier commandeering of their weekend, realized that Rumley meant business. But they were also angry.

Bobbie Chutzpah, in fact, was so angry that she could have served as an

emergency power supply for the corporate computers. Her Saturday plans called for tennis, waterskiing and a romantic interlude with the Robert Redford of the computing installation. Sacrificing those carefully conceived plans for Rumley and Sched was about as satisfying a prospect as being assigned to maintenance of the corporate payroll program. By the time her appointed hour rolled around, Bobbie's violated sense of principles was about as potent as the company's — and Rumley's. The grounds for a classic confrontation were laid.

Interview Scene

Let me set the scene for the interview which followed. Picture an office — Malcolm's office, it was — with a desk dominating the center and Rumley Powerplay seated behind it, exuding confidence. Malcolm, meek as milk toast, sat in a corner, psychologically almost absent, uncomfortable to the hilt. Rumley not only had Malcolm's job, but he had preempted his office and was sitting in his chair. Malcolm appeared almost as a servant, available to Rumley should the new plantation master need his services.

Bobbie was shocked when her turn came, and she entered the room. She could almost imagine that Rumley had just barked out the command "Malcolm! Grovel."

The early part of the interview went well. Bobbie realized that Sched has been deceitfully promoted and she could truthfully tell Rumley what he wanted to hear. Malcolm shifted uncomfortably in his chair, but it was ob-

READER COMMENTARY/Lindsay L. Baird Jr.

Federal DP Crime Bill: A Much-Needed Measure

Wayne Douglas Bennett's comments in "Arguments Against Crime Bill Don't Hold Up" [CW, April 7] have a great deal of merit. I would like to add my voice and support to obtaining passage of the Federal Computer Systems Protections Act (S. 240), a much-needed piece of legislation.

It appears that the staffs of Sen. Paul Laxalt (R-Nev.) and Orrin G. Hatch (R-Utah) are not doing their homework — let alone keeping the senators informed. There is more than ample evidence supporting the need for computer crime legislation contained in the U.S. Senate Committee on Government Operations reports. It was these reports that prompted Sen. Abraham Ribicoff (D-Conn.) to introduce the Federal Computer Protection Act in 1978 and again in 1979.

I testified on the dimension of the computer crime problem before the Subcommittee on Criminal Laws and Procedures of the Committee on the Judiciary in 1977. Sen. Hatch, the acting chairman of the subcommittee, opened the hearing and then promptly left — staff members then took over. I testified as chairman of the Computer Secu-

rity Committee, American Society for Industrial Security (Asis).

Recently, I incorporated portions of this testimony in my response to the current committee chairman's request for comments pertaining to an article written by John A. Taber ["On Computer Crime (Senate Bill S. 240)", *Computer Law Journal*, Volume 1, Winter 1979, No. 3.] Taber was one of the four witnesses that spoke against S. 240.

Among the four arguments against the bill's passage listed in Bennett's commentary was "the bill is largely supported by a 'gaggle of commercial firms that specialize in computer security' and others with similar vested interests." Hogwash! The Foreign Corrupt Practices Act contains much more incentive for industry to improve DP security than does S. 240. With or without S. 240, concerned executives will turn to the marketplace for the tools and skills they require to enhance systems audit, control, integrity and security.

Following are excerpts of Baird's letter to Richard H. Krueger, director of corporate security at Digital Equipment Corp. and chairman of

(Continued on Page 64)

HUMAN CONNECTION/Jack Stone

Mini DBMS Aids Research in Doctors' Office

Computer-based medical research, to most DPs, brings to mind some hefty computer machinery churning through masses of medical data, searching for answers to critical medical questions. Furthermore, we tend to associate such efforts with large, university-related hospital centers which have the research talent, facilities and services necessary for the proper conduct of significant projects.

But the minicomputer-oriented data base management system (DBMS) is helping to spread the research wealth around, all the way out to the doctor's office. As a case in point, a group of four physicians in St. Louis, engaged in the private practice of vascular surgery, was able to justify its Wang Laboratories, Inc. 2200VP for research studies and office administration only after it was outfitted with the Aims-II DBMS (OEM by Viacom Systems, St. Louis).

I interviewed Kathy Gentry, a physician's assistant (PA) and medical researcher employed by the group, on their system's successes.

Q: Kathy, what is a physician's assistant?

A: A PA is a relatively new breed of medical practitioner who provides di-

rect support to the physician. The PA must have a college degree and a minimum of two years' experience in a medically related field. Then the PA must complete a two-year course of study and receive national certification.

Q: Could you tell us a little of your background in the computing field?

A: My experience with computers is similar to that of many people in the field of medical research. We are in the category of "end user" in that we employ the computer as one of many tools to perform our research studies. We understand the basic functions of the machine and its processing tasks, but our interaction is limited to data entry and examination of printout. Knowing about the internal operations of computers — or programming — just hasn't been necessary for me.

Q: Would you describe the research conducted at your office?

A: Glad to. Many patients with vascular diseases require what we call "invasive" diagnostic procedures, which involve the injection of certain dyes into the bloodstream and the outlining of vessels by X-ray devices. These tests give us important information about the nature of a patient's vascular prob-

lems, but they sometimes result in undesirable side effects and cause patients discomfort.

Our "noninvasive" laboratory studies involve diagnostic procedures with devices external to the body — such as audio or electronic sensors — for blood flow analyses. We are comparing these laboratory diagnoses with the X-ray results to establish the validity of the tests.

Q: And how is your computer system being used?

A: The machine is assigned to patient billing and collection applications for about two hours a day. Data entry for blood flow analyses occupies another two, and I have it for the balance of the day for the design of computer-based research applications and the retrieval of research results.

Q: Computer systems design? I didn't understand that you had this kind of experience.

A: I didn't before I started, but, as a software management system, Aims has the facilities to allow me to design my own DP applications. It uses a "bouncing ball" type of indicator to drag me through the parameter selection process; I provide the same design specifications I used to give to my sys-

tem analyst, but now I hand them over to the machine instead. The system has everything we need for our research, except built-in statistical routines which we plan to add later.

As a matter of fact, a major reason we were able to justify the machine was that we didn't need any part of the usual complement of people that come along with a large computing center. The machine handles the chores of analyst and programmer.

Q: Kathy, you seem quite enthusiastic about your computer system. Ever thought about giving up the rigors of medicine and becoming, well, one of us?

A: Oh, no, never. Sure, I have become more interested in learning to program and finding out more about systems, but a medical career is far more interesting and rewarding. As a PA, I have the opportunity to spend time with patients, working up histories, listening to their problems and educating them on what to expect from various procedures, and this is time that my doctors can't often spare. Without the computer system, we couldn't meet all of our research goals, but in no way does it replace a single "thank you" from a patient.

Federal DP Crime Legislation . . .

(Continued from Page 63)
Asis' Computer Security Committee:

John Taber's contention that S. 240 contains "fatal flaws . . . is a bad bill, a dangerous bill and should be opposed" is in error.

The general thrusts of Taber's arguments are that computer crime is not a problem, larceny and embezzlement are mislabeled as computer crimes, existing criminal law is sufficient for prosecution and unauthorized use of computers by DP professionals is both an established and accepted practice throughout the U.S. Following are my own thoughts.

First, we have a problem of definition: What is a computer crime? True, it is a larceny, embezzlement or fraud committed by an individual, and there are existing laws addressing these crimes. However, utilizing computers in the commission of a crime provides the perpetrator with the ability to divert significant quantities of assets. For example, in the August 1979 issue of *Digital Design*, the Federal Bureau of Investigation reported the following about crimes associated with banking: The average loss in bank robberies is about \$3,200, while acts of fraud or embezzlement not involving computers average \$23,500. Acts of fraud or embezzlement involving computers result in average losses of \$500,000.

In 1974, I co-chaired an American Management Association computer security seminar with a computer manufacturer's representative. During his presentation, he related the results of a year-long (1973) study his company conducted in the area of dishonest DP employees. He reported the following:

- Between 20 and 30 events of dishonest activity were reported each month during the study.
- The average loss per event approximated \$674,300.
- Eighty-five percent of the subjects identified in the study were not prosecuted.
- Only one in five of the subjects referred to the courts received a sentence imposing confinement.
- The odds of a person going to jail are one to 33.

Assuming that there were some 125,000 computing systems in place in 1973 and knowing this manufacturer's approximate share of the market, I have estimated that some 400 to 600 computer crimes may have been committed in 1973, resulting in losses of some \$270 million to \$405 million. Loss projections for 1980, based on 680,000 installed systems, suggest between 1,810 and 2,720 com-

puter crimes will be committed at a cost of \$1.2 billion to \$1.8 billion.

These projections were based on the assumption that only 15% of such crimes are detected. The actual number of computer crime and associate losses may be grossly understated. The FBI was quoted by *Digital Design* stating that only 1% of computer crimes are detected and of these only 12% are reported to law en-

forcement authorities.

A note of caution: no one really knows the true dimension of computer crime or abuse. Donn B. Parker's work in the area is frequently quoted by Taber. Parker's main sources of information are newspapers, trade journals and so forth. It is noteworthy that in early 1974 he announced the results of his initial efforts to determine the extent of computer abuse in the U.S. At that

time he had data on some 148 instances of computer abuse — the first took place in 1963. However, the hardware manufacturer recorded not less than 240 nor more than 360 unlawful events in just a one-year period. It is apparent that there may be a serious problem, but its true dimensions are as yet unknown.

Existing law and regulations require that crimes and losses be reported to appropriate

... Necessary as Strong Deterrent

authorities. However, it is a fact of life that business, as well as government, is reluctant to report computer crime. There are several basic reasons for this:

- Embarrassment.
- Bad publicity.
- Risk of revealing other questionable/unlawful activity.
- Possible stockholder lawsuits.
- Securities and Exchange

Commission.

This is not speculation on my part, but rather observations based on personal experience. I have worked on somewhere between 20 and 25 "computer crimes" since 1971, and only one of those was reported to authorities for prosecution. Losses ranged from a high of some \$17 million to a low of \$40,000.

My experience is not unique. There are probably less than a

dozen good private practitioners working in the computer crime area. I have discussed with most, if not all, of them the reluctance of victims to report crime to the proper authorities. Without exception, they related that victims were very reluctant to report crime — for the basic reasons stated above.

I have reviewed the annual reports of a number of my clients that had experienced sig-

nificant losses from a computer-assisted rip-off. Not once did they indicate that a serious erosion of profits resulted from criminal activity of any type. The losses were no doubt conveniently buried in one or more expense items.

Most laws that address white-collar crime (computer crime is now included in that category) prescribe a maximum penalty of five to 10

years' confinement and/or a fine of some thousands of dollars. With unlawful gains derived from computer crime averaging \$500,000 or more and the relatively mild criminal penalties confronting a perpetrator, the economics associated with computer abuse are much more of an encouragement than a detriment. Accordingly, S. 240 or similar legislation, authorizing fines of up to 2-1/2 times the amount diverted and up to 15 years' confinement, is required. Without such legislation, it will be evident to many that crime, especially computer crime, does pay.

Taber also stated that "Unauthorized use of computers is widespread among programmers." I agree; however, it is not limited to programmers but rather applies to most DP professionals and to some extent the user communities. He feels that their playing ticktacktoe, drawing calendars and pinup girls, balancing check books, charting stock performance, computing mortgage tables and so forth with their employers' computer resources is harmless.

It may be "harmless," but it still represents in most instances an unauthorized diversion of a valuable company resource for personal use. The argument that curbing such unauthorized computer use is "an intolerable infringement on their [computer professionals'] creative freedom" is without merit. What ever happened to old-fashioned work ethics?

It should be up to the employer to authorize personnel to utilize such resources for "creative" or personal use.

Baird is a management consultant based in Mountain Lakes, N.J.

A solution to a human problem in information management.

The Bell System knows that information management works best when it's people-oriented. After all, that's been the basis of our business for years.

So our Dataspeed® 4540 data communications terminal is human engineered.

It has a display unit with a tilting screen to eliminate glare and eye fatigue. Plus simplified controls on the console. And you get a choice of keyboards with numeric cluster arrangement.

Of course, the terminal is every inch an information management problem-solver that transmits at speeds from 2400 to 9600 bps efficiently and has built-in diagnostics and greater hardware flexibility.

Its microprocessor-based controller interconnects with up to 32 devices. Eight of them can be printers which can be located up to 2000 feet away from the controller. Keyboard displays can be up to a mile away.

The Dataspeed 4540 data communications terminal. You can expect it to add efficiency and economy to business applications involving inquiry response, data entry and retrieval.

With our knowledge, our advanced communications technology, our thousands of experienced information management specialists—and with service that is superb—we can help your business. A call to your Bell Account Executive will put our knowledge to work for you.

The knowledge business

Beauty and Brains. In the history of the computer there has never been an intelligent terminal like the ECS 4500. It is singular both in its external design and internal architecture. Singular in its power to function as a stand-alone computer and as multiprotocol network computing terminal. Singular in its ability to interface immediately with virtually any mainframe or minicomputer. With a complete repertoire of software and high level languages. Information systems of the coming decade will emulate this architectural elegance. Only ECS 4500 makes it all available to you now.

THE TAYLOR REPORT/Alan Taylor

Lawyers Addressing Noncontractual Rights

It takes time to get a handle on a new situation, but the signs are that lawyers are beginning to get a handle on computer contracting as it is normally practiced in this country. Instead of simply dealing with contract law, where the odds are seriously against the computer buyer, articles such as David Connelly's (Reader Commentary, April 28 and letter, May 19) show an advance in legal attitudes. Some lawyers are finally bringing home to DPers both what noncontractual protections they do have and the need to defend such rights.

When the members of a DP department feel that a vendor has let them down, they complain: "They said the software would be available, and it wasn't," or "The configuration was to handle 24 users, but we could never use it with more than seven."

These and many other user complaints concern some vendor statement or promise that has turned out not to be true, but the user has to live with the results.

Connelly has said that DPers may not have to live with some of these complaints and may be able to seek remedies in the courts, despite anything the contract says.

This is a very different viewpoint and is vastly more realistic than one that goes no further than contract wording — provided that the message gets through. The problem is, because of differences in language and outlook, I am not certain that the message will get through.

Connelly uses legal terms such as "unconscionability" and "fraud" that have very different meanings in the worlds of law and computers. For example, fraudulent statements can be made quite innocently by a computer salesman, although to nonlegal minds the very word "fraud" suggests conscious falsifications. To lawyers, it is just a type of behavior that may or may not be conscious. And the less said about lay interpretations of "unconscionability" the better!

Because of these language differences, DPers don't normally pick up the implications of articles such as Connelly's, so let us try to arrive at a commonly understood basis in three areas he touched on — illegal marketing methods, dangerous descriptions and the cost of protection.

Illegal Marketing Methods

In the U.S., businesses are only allowed to operate within certain public-policy limits with respect to their marketing and other operations. These limits change from time to time and from state to state, but do come into play to protect society from bribery, bait-and-switch tactics, overbroad denials of liability for damages caused and various other offensive trading practices which can be found in DP procurement environments.

The effectiveness of U.S. and state court remedies when such illegal actions take place can be spotty, but it can be very effective, ruling out unfair contract clauses or tossing out the contract altogether.

It doesn't matter that the buyer accepted the contract. At stake is the right of the public, and not just the

buyer, to be kept free from such "unconscionable" trading practices. The court is protecting this right when it refuses to enforce contracts obtained with improper methods against the computer user.

Dangerous Data

Within the category of improper behavior, another whole area deals with truthfulness and completeness of information available to the buyer. Specifications, proposals, claims to know that equipment will fit and so forth are the subject of a separate right — the right to be honestly and openly informed during contract preparations.

Again, society takes an interest here, because the overhead of having to totally distrust anything you can't see and weigh would be too much for effective and economic commerce in many areas, including DP.

Society intervenes by protecting the buyers from lies, from mistakes and from not being forewarned of dangers that they can't see for themselves.

There are some limits as to what has to be disclosed, particularly where no bodily harm is involved, as it rarely is in cases involving computers. Still, recklessness, lying or covering up information is often punished by knocking out a contract. This can often get a

computer user free of a five- or seven-year contract that has gone sour.

Cost of Protection

The final item that Connelly really broaches is the matter of the economics of law and computer operations. What does it cost a user to get the courts to keep a computer vendor within the law or to make the vendor pay for any transgressions? How can such costs to the user be minimized?

Again, Connelly went into legal jargon, with references to items like business practices exceptions (an important, seldom-taken, early precaution).

(Continued on Page 68)

SPACING OVERLAY TEMPLATES

FROM
**LEVITT
PRODUCTS
COMPANY**

The Levitt Products Company announces development of the only precision overlay template designed especially for the software, drafting or graphics data professional.

Levitt precision Overlay Templates are fabricated from a durable photographic film under exacting conditions to assure the user a quality and dependable tool.

Also available for use with the Levitt Templates are the Template Marking Pens, specially designed to rub off and leave the Template clean and ready for further use.

These Templates make spacing rulers obsolete! Now modifying reports, testing print positions and checking printer proofs can be accomplished quickly and easily.

Formats may be designed directly on the Template. When modifying reports, the user simply lays the Template over the report, marks additions or deletions. When the layout has been completed, the Template

markup can be photocopied for documentation. Wipe the template clean and it is ready for additional use.

Templates are available in two sizes, large (22"x13") for full size reports or layouts, and a smaller version, (5"x16") that fits easily into a briefcase or desk drawer. Even in its largest size the Template is a flexible, durable tool not easily damaged.

All Templates are available in 10 CPI (Characters Per Inch) by either 8 or 6 LPI (Lines Per Inch) configurations. Prices start at \$34 for the large Templates and \$21 for the small template. The Levitt Products Company offers significant price reductions for quantity orders.

Ordering or additional information may be obtained from Levitt Products Company, P.O. Box 4308, San Leandro, California 94579, (415) 483-2241

Lawyers Advising on Noncontractual Rights

(Continued from Page 67)

At least the importance of this type of precaution is surfacing at last.

The oldest and easiest way to lose legal rights is to assume that the courts have the duty, time and inclination to ferret out the facts and punish the lawbreaker and that the user only has to care about the law, but not the dollars or the mechanics! Anyone who relies on this misconception of our court system will be just as likely to lose his case as win it, no matter how strongly the law is on his side.

U.S. contract law in itself is unable to control current computer marketing practices. Buyers need normal standards of protection for their purchases of computers and should be aware of the noncontractual landscape and as-

sociated costs.

However, the real proof of the need for lawyers to start understanding how to handle computer-vendor misconduct comes from history and the track record. During the past decade, I have watched a handful of abused users really fight, while most stand aside and pay up.

But when users have fought, they

have collected thousands, hundreds of thousands and even millions of dollars because of such misconduct!

At the same time, I have also watched analyses showing that computer overselling is profitable! And overselling has continued, together with the development of tighter and tighter contracts clearly aimed at permitting behavior that would normally be forbidden in

this society.

If users are to have a fighting chance, both the lawyers and the DPsers have to understand the situation and talk to each other — in the other's language.

May I Have an Act of God, Please?

(Continued from Page 63)

by a specified date. And Bobbie began balking. She was perfectly willing to give a best-estimate completion date. But a firm, cross-my-heart-and-hope-to-die completion date was as unrealis-

tic as the original Sched promises, she knew.

Rumley bore in constantly, phrasing the same question in infinitely variable ways. "When will you, without question, be finished with your part of

Sched?" And Bobbie, trying to stay calm, responded with her best estimate — and no firm commitment.

"With this change of management, the company is now behind Sched 100%," Rumley began again. Malcolm coughed; it looked like he might dry up and disappear any minute. "We can get whatever resources you need to support your commitment, make it happen. Tell me what resources you need and I'll get them for you."

It was obvious to Bobbie that Rumley meant the traditional, things like improved turnaround and better key-punch support. But something snapped in her, and her anger boiled out. His confidence, the confidence that he had the power not only to coerce her commitment but to somehow mold the world to fit her new commitment, was pompous and unbearable.

"All right, then, Rumley," she said, her eyes like laser senders boring through the charged room into his, "I'll tell you what. I'll give you my commitment."

"Rumley," she continued, "I'll need an act of God, please."

She turned on her heel, crossed the room quickly, opened the door and left. But out of the corner of her eye she noticed two things. Rumley's fading victory smile was crumbling into defeat. And Malcolm, his hand to his mouth, was barely restraining a laugh which had engulfed his whole face.

Improved System Technologies Inc.

Designing/Documenting User Procedures

Dear Colleague:

The best software in the world is useless if the people who have to make the system work don't know how (because they have not been trained) and/or can't find out (because the documentation is inaccurate and/or incomplete and/or incomprehensible). This is particularly true for terminal users of on-line systems.

IST has developed a new seminar which integrates certain of the structured technologies (data flow diagrams, decision trees, structured English, logically "tight" English) with recent psychological research to create a new and better approach to enabling people to use systems.

First we study ways of designing a system to minimize the need for user documentation and training in the first place. Then we show how to create the best type of documentation for each type of system, and how to test it -- we hold that the personnel subsystem (the procedures carried out by people) should be developed and tested just as carefully as the computer subsystem (the hardware and software). Lastly, we show where documentation fits into a structured methodology and systems analysis and design.

If you are a systems analyst, system designer, on-line programmer or technical writer, we have some valuable new techniques for you.

Public presentations of our three-day seminar, "Designing/Documenting User Procedures using Structured Techniques" will be given:

June 24-26	Houston	August 19-21	Baltimore
July 22-24	Chicago	September 9-11	Atlanta

To enroll, or for more information, call John McCann at (212) 586-1098, or return the coupon below.

Endorses ACU Efforts

As a regular reader of *Computerworld* I would like to comment on the April 14 article about the Association of Computer Users' (ACU) testing of small computers entitled "Runtimes of IBM 5110 Found Unimpressive." The contents were presented in a simple fashion, and emphasis was given to the fact that benchmarks alone are not the criteria for selecting a system. This I fully endorse.

I would like to encourage more articles of this nature. Even though this job of comparing computers is rather overwhelming and different standards of measurements are used by various organizations, I welcome the approach of the ACU.

Thomas W. Hunt

Also Adds Extended Rental Options Cincom to Hike One-Year License Fees

By Marcy Rosenberg
CW Staff

CINCINNATI — Citing skyrocketing prime rates that have increased the cost of financing software leases, Cincom Systems, Inc. will increase one-year lease license charges an average of 3.8% for systems software products on July 1.

Also effective on that date, the firm will add three- and five-year term rental options which, according to a spokesman, will reduce customers' monthly payments by up to 20% compared with the increased fees under the one-year plan.

With this announcement, Cincom claimed it is the first software house to offer extended, nonequity rental plans.

In addition to short-term lease licenses — in which all usage and support charges are bundled into the monthly fee — Cincom also offers a long-term single-use license payable up-front, which covers all fees except annual usage and support charges after the first year.

Annual Usage Fees

While long-term single-use license fees are unchanged or, in some cases, were lowered from last year's levels for major systems software offerings, annual use and service fees were recently adjusted to 10% of the single-use price for all products.

Setting a uniform 10% charge hiked annual use and service fees for 58% of the vendor's systems software products — for an average increase of 5.3% — while reducing or maintaining the same annual usage fees for the remainder.

Annual usage adjustments take effect on the anniversary dates of individual agreements, according to Wilbur V. Hansen, director of corporate planning and pricing.

Hansen described how the pricing changes will affect new users and existing customers. The cost

of a single-use license for the DOS Total data base management system, for instance, remains at \$45,000, but the annual usage charge, now at 10%, rose to \$4,500 for 1980-1981 from \$3,250 in the 1979-1980 period.

And after July 1, lease license customers on a one-year plan will be charged \$1,350/mo, up from \$1,125. Under the new three-year plan, a lease license will cost \$1,285 and, for five years, \$1,150.

Similarly, single-use licenses for OS Total still cost \$56,500, but annual usage charges jumped to \$5,650 compared with \$3,650 a year ago. One-year monthly lease prices also increased from

\$1,400 to \$1,695, with three- and five-year lease charges set at \$1,610 and \$1,440, respectively.

On the other hand, annual usage charges for Honeywell Total, which costs \$38,500 for a single-use license, dropped from \$7,900 to \$3,850.

Also falling were single-use license and annual usage fees for DOS and OS versions of Environ/1, Cincom's teleprocessing monitor. DOS Environ/1 now costs \$24,500 for a single-use license, compared with \$35,000 last year, with annual usage charges dropping from \$3,000 to \$2,450.

Similarly, Cincom reduced single-use license fees for OS

Environ/1 from \$42,500 to \$34,200 and cut annual usage charges from \$3,750 to \$3,420.

Monthly Rates

Monthly one-year lease rates for both Environ/1 versions have gone up, however. For the DOS version, licensees on a one-year plan will pay \$735/mo, up from \$700, while OS users will be charged \$1,025 compared with \$975/mo last year.

Three- and five-year monthly lease payments for DOS Environ/1 were set at \$660 and \$590, respectively; comparable fees for the OS version are \$925 and \$820.

(Continued on Page 72)

From Idea to Profit — Part 4

Approaching Marketers Outlined

By A.L. Frank
Special to CW

Armed with a packaged and priced product, the developer is now ready to approach selected software companies.

The firms he considers, though, should have products that are marketed to a customer base similar to that in mind for the new product.

By determining the product lines of different companies through directories such as Data-Pro Research Corp.'s, a developer can identify which vendors would logically market his type of product.

The first step in approaching a company is to send a carefully written letter outlining the developer's intent and the product's functions to the executive in charge of product acquisition. The name of the appropriate executive can be obtained simply by calling the company and asking.

If a company does not have an individual directly responsible for product acquisitions, then the

developer can address his letter to the firm's president, whose name will probably be included in the software directory describing the company's products.

It is best to approach two to five companies at first to allow the necessary time for the second

Part four of this five-part series on bringing a home-grown software product to market gives advice on how to approach a software company to market your wares. Next week: the pros and cons of various marketing arrangements.

step — personal follow-up. Initially, this follow-up would just be a phone call to determine if the executive to whom the developer has written has any interest in the product.

Most organizations will discuss the general nature of the business arrangements in which they engage during the initial contact, but few are foolish enough to

volunteer any financial parameters until they have evaluated the product.

Similarly, the developer should also be prepared to volunteer general information and a product description at this point, but should not provide the company with confidential information such as technical documentation or source code.

Evaluation Stage

Once negotiations reach the evaluation stage — when confidential information must be revealed — the developer should obtain a nondisclosure agreement from the organization.

If a company is truly interested in the product, it will probably be willing to send a representative to discuss it further.

However, it is often to the author's advantage to visit the software firm first to determine the nature of the organization and its facilities, as well as to establish a personal relationship.

The author should remember (Continued on Page 72)

IBM DOS USERS DOSSIER DOES IT AGAIN

"DOSSIER has a super ability to detect changed programs—even changes as small as one byte."

Patrick Eiting, Systems Software Senior Analyst, Fort Wayne National Bank
Patrick Eiting knows all about program changes. When he began his career in data processing 12 years ago, he was the one who had to keep track of those changes. Now DOSSIER does it for him.

"It lets us see what's in the core image library—a great help in program analysis."

"The Called Program Analysis facility is a useful tool for managing relocatable libraries."

"DOSSIER is the slickest thing I've ever seen. A real time-saver."

Try DOSSIER free, without obligation, for 30 days. Discover why more than 500 companies are already using DOSSIER to upgrade, maintain and clean up DOS, DOS/VS or DOS/VSE libraries.

For more information, just clip this coupon and mail to Computer Concepts, Inc., 6443 S.W. Beaverton Highway, Portland, OR 97221. Or call 503/297-4741.

DOSSIER goes beyond source library documentation to translate object code from program libraries into complete and current program and file information. Its 16 management reports address all aspects of controlling and auditing object libraries.

The Transparent Single System Image Has Arrived!

With the recent addition of the Global Console Director (GCD) to Allen Services' line of software packages for Multiple System environments, an entire complex of systems can now be treated almost as though it were one **single unified system**.

The complete "unified system" effect is achieved through combined use of three independent (but related) program products. Each of these, Super-MSI, MSM and GCD addresses distinct concerns present in multi-system environments.

Of course, since the products are independent, if you aren't yet ready for the full-blown unified system effect, you only need to select the products which interest you.

UNIFIED DATA INTEGRITY (including VSAM)

The Multiple Systems Integrity Facility provides the same thorough dataset integrity protection for jobs in **different** systems that would exist if the jobs were in the **same** system. In addition to propagating "standard" dataset integrity across systems, Super-MSI also insures that the VSAM "internal" SHR options are honored throughout your entire complex. Effective cross-system VSAM integrity can be obtained in no other way than through the use of Super-MSI.

Another feature: Super-MSI also eliminates the hardware **RESERVE lockouts** which are normally inherent with SHARED DASD in multiple system environments.

Much more besides: Super-MSI has many other exciting features including special aids for operators and TSO Users. All in all, Super-MSI will be a very powerful addition to your installation.

UNIFIED DEVICE MANAGEMENT

The Multiple Systems Manager manages the allocation of TAPE and MOUNTABLE DISK devices across all systems in your complex. It allows you to operate normally with **all** devices **ONLINE** to **all** systems. MSM insures that device allocation by jobs in different systems occurs just as if all jobs were operating in one single unified system.

MSM eliminates the operational burden of juggling TAPE and DISK units among systems. It protects against the danger of a system accidentally rewinding or overwriting a TAPE in use on another system; this removes the single greatest cause of shared tape mishaps.

MSM will use your TAPes and DISKS more efficiently — which can result in immediate device cutbacks or (more likely) postponement of future acquisitions.

MSM is so transparent that it can be operated without the use of any new operational commands. Of course, there are powerful new commands available — however these are extras, not necessities.

Only MSM allows such truly NATURAL and transparent shared device management.

Other features (for MVS environments only):

- The MSM Device Preferencing capability allows devices to be dynamically structured into a hierarchy of sets; MSM insures that units in preferred sets are used, wherever possible, before less preferred sets.
- The MSM **SOFTSWAP™** feature insures that DDR device SWAPs for TAPE units will **NOT** impact JOBS or TSO users which are not using tape allocation. Without **SOFTSWAP™**, TAPE DDR SWAPs are likely to impede all allocations in a system — including even those which do not use tape.

UNIFIED OPERATOR CONSOLES

The Global Console Director is an extremely flexible tool. It allows (selected) message streams from different systems to be logically "blended" to create a **unified system image** (to whatever degree desired). In a slightly different vein, GCD allows **any** console on any system to be logically attached concurrently (and perhaps in different ways) to any set of systems in your complex!

GCD allows commands entered from any console to be directed and processed anywhere in the complex; in this respect, all consoles are effectively linked to all systems.

In almost every aspect, GCD is philosophically and operationally compatible with the standard system console support.

GCD can improve overall throughput by simplifying operations. By allowing several physical consoles to be logically merged, excess devices can be eliminated for immediate savings, or deployed elsewhere to strategic advantage.

GCD is absolutely transparent to your users, and aside from major simplifications, nearly transparent to operations.

If you wish to use more than one of the above products, they can be integrated together into a single control task (thus further reducing overhead and complexity). In nearly every instance where our products have been competitively evaluated against all possible hardware or software alternatives — our software has been chosen. Aside from IBM, Allen Services has been providing commercial software specifically designed for multiple system environments longer than any other company. Over 400 major installations throughout the world have already selected our products as the preferable means of handling problems associated with multiple system environments. The number grows daily. **Reliability** has always been an integral part of our design.

When considering software, most people consider **support** to be a very important factor — Allen Services has over 200 support personnel.

The only other comprehensive approach to unifying multiple systems is JES3 (or ASP). Aside from the fact that MSI/MSM/GCD can be installed and implemented in only a few minutes, there are several other significant differences from JES3: For example, MSI/MSM/GCD (combined) use only 1% to 2% overhead; MSI/MSM/GCD are invisible to your users; MSI/MSM/GCD were designed to be strictly compatible with OS/VS/MVS philosophies — in this regard none of your personnel will require re-training.

The majority of all eligible multiple system installations are now using our products to help manage their systems.

Because installations can have widely different characteristics, you may still have a nagging suspicion that our claims may not actually apply to your shop. To alleviate this doubt, we invite you to try our products (whichever ones interest you) at your own installation under your own conditions. This trial carries no charge and is without obligation. One word of caution: You're going to like them so much, you'll never take them out.

Offers Application Packages Microdata Debuts at NCC as Software Vendor

By Jeffery Beeler

CW West Coast Bureau
ANAHEIM, Calif. — Microdata Corp., which in the past has confined itself primarily to shipping hardware, soon will begin supplying application software as well.

The software, which was introduced here last week at the National Computer Conference, will be the first set of application packages Microdata has ever sold directly. In the past, the minicomputer manufacturer's users have always developed their application software on their own or obtained it indirectly, either from the vendor's independent dealers or from third-party suppliers like system houses.

Microdata's first offering of applica-

tion software will consist of nine integrated packages, known collectively as Results. Five of the packages — payroll, accounts payable, accounts receivable, general ledger and financial reporting — will form Results' financial management system.

The other four modules — order/invoice processing, inventory control, sales analysis and purchase order processing — will constitute the family's distribution system, a Microdata spokesman said.

Users can buy and integrate the nine packages, which are designed modularly, in any combination they wish and later add modules as their business needs dictate, the spokesman explained. To a large extent, they can re-

portedly custom-tailor the packages to suit their application requirements.

Although Results is intended primarily for Microdata's newest users, the product line is also said to be suitable for the company's long-standing customers, which have already obtained packages from independent sources. If users of the latter category want to add Results modules to their existing application software library, they can reportedly do so with little or no trouble.

During the next few months, Microdata intends to follow its Results family announcement with introductions of additional application-software packages, the spokesman added.

Deliveries of Results' financial management system will begin in June;

shipments of its distribution system, two months later. Both will be available only through Microdata's direct sales offices, not through its independent dealerships.

The accounts payable and receivable packages will cost \$1,800 each; the financial reporting and sales analysis modules, \$1,000 each; the payroll and inventory control packages, \$2,500 each; the order/invoice processing module, \$3,000; the general ledger unit, \$1,500; and the purchasing order processing package, \$1,200.

More information about Results is available from Microdata, 17481 Red Hill Ave., Irvine, Calif. 92705.

Geisco Puts DBMS on Mark III

VIENNA, Va. — General Electric Information Services Co. (Geisco) has added a data base management system (DBMS) to its Mark III remote computing services. DMS Level 3 is said to facilitate information retrieval and improve programmer productivity.

The DBMS consists of two basic components: the DMS language, which is used for English-like updates and queries to the data base, and the Hierarchical Index Sequential Access Method (Hisam), a data storage and access technique that automatically

structures data for efficient storage and retrieval, the vendor claimed.

Hisam is, in effect, the data base manager incorporated within the DMS system. It defines and manages the relationship among the various data elements which subsequently are accessed and manipulated through the DMS language.

Features added in Hisam Level 2 include expanded capability of the data base manager to handle data bases up to 1G characters, direct access of dependent records, which improves the

efficiency of data retrieval and an increase in the file size from 4,000 to 16,000 pages.

Although Hisam is an integral part of DMS, it is available separately to Fortran programmers requiring its data-handling capabilities.

Value-added conveniences have been incorporated in the DMS Level 3 service which are said to remove a number of tedious programming tasks from the user. New DMS features include:

- Multiple key access, also known as inverted file structure, which provides the capability of specifying, without restriction, the elements within the data base that are to be key fields.
 - Multiple reports, now permitted automatically from a single program.
 - Report formatting options.
 - Multiple hierarchies, now allowed within a single Hisam file.
- DMS Level 3 generates Fortran 77 code.

Proprietary products of Geisco, both DMS Level 3 and Hisam Level 2 are upward-compatible with DMS Level 2 and Hisam. DMS Level 3 costs vary depending on the amount of its usage, the vendor said from Suite 510, 8150 Leesburg Pike, Vienna, Va. 22180.

ABS Updates 'Data Manager I'

COSTA MESA, Calif. — Revision 3 of Data Master I, an interactive parameter-driven data entry/management system, has been announced by Applied Business Systems (ABS).

Written in Data General Corp.'s Multiuser Extended Basic, the system lets users specify file structures and format the CRT for data entry and editing. Revision 3 allows records entered to be stored temporarily in a transaction file and then posted to a new master file.

The revision's most significant feature, according to ABS, is its ability to generate actual program code based upon the parameters entered.

The system runs on 64K-byte DG Novas or Eclipses under RDOs.

The end-user license fee is \$1,750. ABS is at 3303 Harbor Blvd., Building B-6, Costa Mesa, Calif. 92626.

Here's our
low-cost, high-
performance
coupler for
your local
communications
hookup!

You don't need asynchronous modems for most short-haul applications. Get the job done just as well with our Model 7134 Line Coupler for only \$175 each (even less in quantity).

Our coupler is specifically designed for remote terminal hookups, either in-house or up to 10 miles from the computer.

RS-232 compatibility, optical coupling, LED mode signals, and many other performance features assure you of peak transmission accuracy up to 9600 baud.

(213) 595-5601

Steps Outlined in Approaching Software Firms

(Continued from Page 69) that all software companies do not have the same product needs nor acquisition strategies. Therefore, he should not be discouraged by initial negative responses.

Contract Negotiations

There are two basic types of software marketing arrangements: an outright sale of the product to a company, or a sales agent relationship. The actual arrangement, however, is usually a combination of outright sale and royalty payments.

If the developer is to receive royalties over a period of time that are relative to product sales, he should make sure that the marketing organization agrees to provide a training program for technical personnel, salesmen and users. He should also make sure that the marketing organization is obligated to reimburse him for his assistance in the program.

Working out these details and solving contractual problems are the biggest headaches facing a software developer, according to Ross Allardyce, codeveloper of the Resolve product acquired by Boole & Babbage, Inc. in 1976.

"Software presents some unique problems when you

sell the marketing rights and title for some combination of a direct payment and royalties.

"The royalties become especially difficult because they involve future product sales, which in turn are largely determined by how much the software company is willing to invest in promotion, marketing and development.

"These complications make it essential to have a good attorney who knows the software business," he said.

Key Areas

Legal problems can arise in several key areas once the developer reaches the negotiation stage, and he should be aware of them well before reaching that point, Gordon Davidson, an attorney with Fenwick, Stone, Davis and West, remarked.

For example, several questions should be addressed: First, does the developer really have anything to sell and, if so, does anyone else have the rights to it? Second, are the developer's intellectual property rights protected by patent, copyright or trade secrecy laws?

"There is also the possibility that the developer's employer or former employer may have an interest in the work,"

Davidson said, adding "the purchaser or marketing organization will want assurance that the developer's work is original and not subject to claims by third parties.

"The author may have to shoulder the legal and financial burdens of giving these assurances," he said.

Another area where legal counsel is important is in the choice between selling title to the product or licensing just the marketing rights.

"Revenue from an outright sale of all rights and title may be eligible for capital gains treatment, while royalties are generally taxable as ordinary income. Whether capital gains treatment is available depends largely on how the contract is written," Davidson said.

Product acceptance can also

be a delicate issue, he explained, noting "the buyer and seller must agree on legally sufficient definitions of what code, documentation, enhancement plans and product support will be delivered to the buyer and in what time frame.

"The developer's future new product development efforts may become an issue in the contract negotiations.

"Can he develop new products which are similar to the one in question? Will the purchaser or marketing organization have any rights to the new products? These issues need to be legally defined."

Customer Base

Another area requiring clear definition in Davidson's view is whether the developer al-

ready has a customer base and who will be responsible for it once the title or marketing rights to the product are transferred.

"Also, if at some point after the contract is signed, the agreement falls through because of unforeseen problems, there must be some provision as to which party will be responsible for the then current customer base," he advised.

The complexity of these and other issues that arise during negotiations makes it imperative that the developer obtain legal and tax counsel.

Frank, an attorney and former director of corporate development at Boole & Babbage, Inc., is a founder and president of newly formed California Software, Inc. in Los Angeles.

Cincom to Raise License Charges

(Continued from Page 69)

Price adjustments will also impact user sites with more than one Cincom product installed, depending on what those products are. Hansen said DOS customers running both Total and Environ/1 software will pay about 2.4% more this year in annual usage fees, which will rise to \$12,160 from \$11,880 in 1979.

If under a one-year monthly lease license plan, these same customers will pay \$3,650 after July 1, up from \$3,210. Three- and five-year monthly lease options will cost \$3,340 and \$3,040, respectively.

Hansen claimed that opting for longer-term leases will benefit users of multiple Cincom products currently under one-year plans. For example, an installation running OS Series 80 Total, Environ/1, T-Ask on-line query and the LMS-II on-line programming software would save \$9,780/year by choosing the five-year over the one-year rental plan.

Generally, Series 80 Total customers can reduce their

one-year rentals by 5% under a three-year plan and 15% with a five-year option, he said, adding similar cost reductions for Series 80 Environ/1 customers would be 10% and 20%, respectively.

Conversion Option

Customers will be able to convert from one-year to extended rental plans at any time, Hansen noted. Terms of the extended rental plans will also permit Cincom to increase monthly rental prices during the contract period with 60 days' notice.

But by the same token, users will be able to cancel an extended rental contract at any time without penalty as long as they give 60 days' notice.

Over the life of Cincom's

systems products, the percentage of customers that lease the software rather than purchase single-use licenses, has increased from about one-quarter to one-third.

Hansen expects these numbers will continue to grow slightly, because an increasing number of systems software products on the market coupled with rapid technological changes in hardware and operating systems may deter user from making long-term commitments.

He emphasized, however, that one-year monthly lease rate hikes were not designed "to swing people to purchase," and that extended lease options were introduced "to reduce customers' monthly lease costs."

The Pascal Software Tool

OMSI PASCAL V1.2™

The value of Pascal in computer software design is becoming widely recognized. And our new V1.2 version contains significant enhancements in ease of operation and reliability. Consider the V1.2 Symbolic Debugger.

Pascal debugging should be performed in Pascal, not with assembler listings and memory maps. Our Debugger knows your data names and structures. Values are accepted and displayed in Pascal notation, including scalars, sets, arrays, records, and pointers.

Complete interactive control displays your original source lines, including embedded comments. Breakpoints give statement numbers and procedure names, rather than octal addresses. The Debugger can show the program execution history, including all stacked procedure calls. Should fatal errors occur, they are intercepted by the Debugger instead of ending your testing.

For more information on our approach, ask for the complete OMIS Pascal V1.2 Product Description.

TELEX 181-592

ON JUNE 27, 1977 A NEW ERA BEGAN IN PRODUCTION MANAGEMENT.

AUTOMATED PLANNING AND EXECUTION CONTROL SYSTEM

APEX.

APEX completely changed the concept of production control.

With Release 3.2, re-announcing Johnson Systems' APEX — AUTOMATED PLANNING AND EXECUTION CONTROL SYSTEM. The first software package that actually helps data centers become even more advanced... more complete... more productive by helping manage their entire thrust.

For one thing, we recognized way back then that production schedules almost never go as they're planned. So, then, APEX had dynamic online production capabilities. The software automatically controlled machine workload based on user criteria... until the inevitable happened: something changed. Even then the user could take immediate action by instructing APEX to re-order the criteria accordingly. Production could continue — in the smoothest, most efficient pattern — until the next change came along, which APEX handled just as easily. For years this dynamic workload balancing and performance management was available only with APEX.

And, to help APEX users know what was *really* going on, we introduced the online

management control and reporting system, no small feat, and the *first* user-friendly automated production control system.

In fact, from JCL management through post-processing, APEX put the word "PLANNING" into automated production control concepts sometime back in 1977. Further, because we've surveyed the industry, we know what your problems are, and what a data center needs to be more effective. We can even include five (5) full days of training, a feature completely unique to APEX.

Since then we've made over 200 significant enhancements, most based on real-world working feedback, some based on technological advances, on what was the first — and still is the only true — automated production control system.

APEX is the most significant single step you can take to improve your data center's productivity. Its been here for years. We at Johnson Systems are pleased that others have finally recognized what we knew all along: APEX — The Most Significant Development in the Software Industry Since the Introduction of OS. You can call us about it today at 703 821-1700.

Devoted exclusively to performance-related data center management products
JOHNSON SYSTEMS, INC. • WASHINGTON • DALLAS • LONDON • DÜSSELDORF

Johnson Systems is independently owned and operated. For more information, contact Johnson Systems, Inc., 7923 Jones Branch Drive, McLean, Virginia 22102 Telex: 89-9100. For more about APEX, write Mr. Tony Thompson, or call 703 821-1700.

Raxco Offers DRS Enhancements

WEST PALM BEACH, Fla. — Raxco, Inc. recently introduced three enhancements to its Data Retrieval System (DRS) data base management system (DBMS).

The first, XBS, is a higher order language interface for externally programming application modules. Multiple logic reviews of the data file may be activated within a single program through field-address-

able subschemata.

A variety of routines are available under XBS for simplified query and update capabilities, the vendor said.

Also added was SIP, a self-contained language that permits definition of transaction displays on CRT terminals. The language allows system development on transaction DBMS.

SIP features include auto-

matic cursor positioning, flexible control of display formats, automatic data validation and procedural error check routines. A hard-copy version of SIP is currently under development.

In addition, RPW, a report writer language, offers branching, looping and conditional and subscripting capabilities.

The three enhancement packages will operate with DRS on Univac. Model 60 CPUs; Digital Equipment Corp. PDP-11/34 superminis and larger systems; and IBM 360, 370, 4300 and 30 processors.

The package will also run on Data General Corp. Eclipse systems, General Automation, Inc. GA 1830 CPUs and Control Data Corp. 6000, 7000 and Cyber series machines.

XBS costs \$7,500; SIP, \$5,000; and RPW, \$5,000 from Raxco at 3336 N. Flager Drive, West Palm Beach, Fla. 33407.

Program Runs Open Items On IBM 5110

PARIS, Tenn. — An open items accounts receivable package that will handle up to 3,800 customers and between 7,500 and 12,000 open transactions is available to IBM 5110 and 5120 users from Data Processing Consultants.

Features of the system include a transaction register, aged trial balance with three levels of detail, selectable aging periods and invoices that remain open until paid.

Providing audit trial listings and entry and editing capabilities for all transactions, the program licenses for \$900 from Data Processing Consultants, 304 S. Dunlap, Paris, Tenn. 38242.

Triangle System Utility Validates Jobstream

SANTA CLARA, Calif. — JCL Check, a system utility software product that validates jobstream JCL before submission to test or production, has been introduced by Triangle Software Co. here.

JCL Check identifies and diagnoses all possible causes of run-time failure and can be executed from a TSO terminal or in batch mode, the vendor claimed.

The product detects errors, such as misspelled names, not diagnosed by the operating system until a job is already in production and also ferrets out errors the operating system may miss completely like "overrides out of order" and "duplicate names," Triangle said.

Four reports are offered with JCL Check. One notes where and why errors occur and the remainder provide complete documentation of a production job stream or system.

JCL Check runs on all OS/VS operating systems and is being offered at an introductory price of \$6,500 through Aug. 1. The monthly rental fee is \$375 and one-, two- or three-year licenses are available.

More information is available from Triangle Software, 2651 Kentworth Way, Santa Clara, Calif. 95051.

QUALITY SYSTEMS AT A PRICE YOU CAN AFFORD.

For Perkin-Elmer 32 and 16-Bit Processors there's only one complete DBMS and Query System:

We spent over five years developing an unexcelled data base management and query system for both 32 and 16 bit Perkin-Elmer processors. The result — success. The system — DDOQUERY.

DDOQUERY offers rapid retrieval using any word(s), phrase(s), or number(s); on-line information with Boolean logic; and over 40 query commands. Another feature, DDOQUERY's report writer provides editing, paginating, counting, adding as well as averaging capabilities.

Sophisticated yet simple. DDOQUERY doesn't require a programmer's expertise. Anyone can use DDOQUERY. Bookkeepers to check credit histories. Secretaries to update annual reports. Or almost any person in the office. Which means you'll save money — lots of it.

And DDOQUERY is easily installed. For more about the affordable DDOQUERY, contact us today.

Another page from the SEED catalog

International Data Base Systems, Inc. would like to introduce you to our company and our complete line of data base management system software.

Since our establishment in 1977, we have developed a reputation for providing powerful, affordable software that is well suited for a wide variety of applications and hardware environments.

Our customers include large and small corporations, research labs, and universities. All we feel, would be happy to talk to you about our products' performance.

All of IDBS's software share several features. It is easy to learn and use, compatible with many different computer systems, technologically advanced, and competitively priced.

We would appreciate it if you would take a few minutes to read the information in this advertisement, and consider the software products it describes for your possible use. We are confident you will find them worthwhile and are proud to present to you, this, our latest catalog of SEED products for your perusal.

Our most important product is SEED, an advanced and comprehensive data base management system that is easy to use, flexible, and inexpensive. In fact, we believe that SEED is more advanced and comprehensive than the better-known, more expensive data base products with which many of you who are reading this advertisement are already familiar.

What you should find most noteworthy about SEED is the fact that it combines great data structuring power and incredible ease of use in one data base software system.

SEED supports both network and hierarchical data structures and allows data base access from either COBOL or FORTRAN. It utilizes a CODASYL-compatible approach to enable your users to easily and confidently use SEED to develop new applications. You will also be interested to learn that SEED has been written in a combination of FORTRAN (for transportability) and Assembler (for efficiency).

Other useful features of the SEED system:

HARVEST is our query language and report writer, and is being used by many satisfied customers, some even "novice" computer users, to easily retrieve information from a SEED data base. With SEED and HARVEST, we have endeavored to make it simple for managers to get the information they need, when they need it, and in the form they want it. We are very proud of HARVEST and sincerely believe that using HARVEST you will find it quite simple to retrieve information interactively. You have only to specify the items in the data base to be displayed and the conditions under which they are to be selected. HARVEST will do everything else. We stand behind that statement, and can tell you of many satisfied HARVEST customers.

report. REAP was written so that your users do not need to know the structure of the data base. Report definitions may be stored for repeated use against different portions of the data base. Features you should know about are: control breaks of up to 15 levels; definition of temporary variables; complete page formatting; functions for total, maximum, minimum, average, standard deviation, and variance; and directed output to a terminal or printer.

use GARDEN to verify procedure correctness, check data base integrity, fix errors in the data base, or create a test data base. Especially significant features include: prompting, conditional tags, "HELP" facility, looping, grouping, stored procedures, and on-line access to the data directory.

SPROUT is a multi-purpose file/data base conversion tool that allows transactions to be processed into and out of a data base. With SPROUT, you will find it easy to convert existing files to a data base. Or, if a data base is already in place, SPROUT can be used to create files for transport to a non-data base environment. Our customers tell us that they have found that SPROUT speeds conversion of data and eliminates the requirement for an immediate switch-over to converted programs.

SEED can be used in many ways around your shop.

We have learned of many ways to use SEED. Our satisfied customers tell us SEED has helped them improve their corporate planning, process control, general ledger, bills-of-material, engineering drawing control, inventory control, investment portfolio management, genetic research, scientific data collection, and employee benefit plan management.

We would be interested in learning about your needs, and how SEED might be able to satisfy them.

REAP is our report writer, and is designed to produce simple or complex reports from a SEED data base without the need for special programming, a feature which we believe you will appreciate. The report definition language is a non-procedural language for specifying the desired

GARDEN is our on-line data manipulation language that will aid the data base administrator and programmer. It provides facilities for interactive update and retrieval. We suggest you

SEED will flourish anywhere.

Our many customers throughout the world use SEED in many operating environments, and help to prove that our data base management system is as flexible as we say it is. SEED presently runs on

IMPORTANT NEWS!
SEED is available for VAX

We thought you would want to know that SEED has been available on VAX in native mode since early last year. As the oldest and most established DBMS on VAX, we have developed the same reputation for performance and service that

reflects the way we like to do business.

There's a small SEED too, for microcomputer users.

We have tried to be responsive to all our customers, and are making available, through Microsoft (whom we believe to be the leading microcomputer software company), MICRO-SEED, which is a compatible subset of SEED. It runs on microcomputers such as the 8080, 8085, Z80, and will soon be available on the 8086 and Z8000, and other popular products, utilizing CP/M and Microsoft FORTRAN. For information about MICRO-SEED please contact Microsoft directly at 206-455-8080.

We want to spread SEED.

We have made a commitment to help others build their products around SEED, and have

put together a discount schedule that will brighten the heart of any OEM or system house.

IDBS 2300 Walnut Street Philadelphia, Pennsylvania 19103

I would like to learn more about the SEED data base management system.

☐ Please call me to discuss my specific requirements.

☐ Please send additional information on SEED and its features.

☐ I have no interest at this moment, but please add my name to your mailing list.

IBM USERS:

INTRODUCING THE SENSIBLE MVS DEVS AND OFFLOAD PRO

And the sensible application system, distributed processing node, back- or front-end processor, and host processor.

They're sensible for four important reasons:

They're easily expandable, so they grow as your application grows.

They're field upgradeable.

They end processor obsolescence.

And they're sensible because they're IBM compatible, so your software and personnel investments are protected.

For example, if you're running MVS, your large-scale system is probably so jammed with critical work that it's hard to get system time to write and test new programs. The solution is a Magnuson M80 dedicated to MVS program development. It provides full MVS capability, but the price tag is just a fraction of what you would pay to duplicate your existing MVS-based system.

Or take that one large application that's bogging down your system. If you offload it to a Magnuson system, you'll get the computing power your application needs, while your host system's users get the response they want.

Strategic Architecture Makes It Sensible

Magnuson's Strategic Architecture makes it all possible. Its bus structure lets you expand in manageable increments, simply by adding more memory or channels. And it gives the M80 a capacity of 16 million bytes of main memory and 16 channels, so you have plenty of room to grow.

Strategic Architecture also puts an end to system obsolescence. You upgrade by simply swapping a few boards; there's no months-long system swap-out, and no expensive, time-consuming software conversion.

Protecting Your Investment- Sensibly

Strategic Architecture also protects the investment you've made in software, training, and hardware.

That's because it emulates the 360, 370, 303X, and 4300 instruction set. So you can be sure all your application software runs just as it did before, no matter who wrote it: you, the vendor, or a third party.

EXPERIENCE THE MAC

DETROIT AREA USERS:
SEE THE MAGNUSON
DIFFERENCE IN ACTION
ON JUNE 4. Call Ferris Judd
at (313) 569-3010 for details.

WORLD'S MOST ELOPMENT SYSTEM CESSOR.

And it makes sense to your staff, too. An M80 does things the same way your mainframe does them, both at the system console and in the software. So all your people can be as productive on a Magnuson system as they were on your mainframe.

It all adds up to the right way to support system applications, old or new. The sensible way.

MAGNUSON DIFFERENCE

'SRF' From Gejac Performance Monitor Fits PDP-11s Under RSX-11M

RIVERDALE, Md. — Geared for users of the Digital Equipment Corp. PDP-11, the System Reporting Facility (SRF) from Gejac, Inc. is said to manage computer performance and capacity in RSX-11M operating system environments.

The performance monitor measures system and peripheral utilization, identifies system bottlenecks and helps users plan for future computer requirements, according to the vendor.

For user and system tasks, SRF automatically logs statistics that show the computer resources consumed by each task. Data collected includes the task name, elapsed time, CPU time, memory size, terminal ID, logon and active UIC, and disk and terminal QIOs.

Global system statistics, such as CPU utilization in the user, executive and idle states, quantify the used and available system capacity, the vendor said.

Credit Industry Gains Support On DG Novas

HICKSVILLE, N.Y. — Targeted for the credit and collection industries, 3CS is an on-line management information system that runs on Data General Corp. Nova computers.

Written in Cobol, the menu-driven software supports from one to 16 interactive CRT terminals and multiple printers, according to its vendor, HDR Systems Associates, Inc.

The main 3CS module contains programs for entering new accounts, applying cash receipts, reporting cash distributions, aged account reporting, printing letters, interactive file inquiry and maintenance and reporting for medical, general consumer and commercial accounts.

Optional Modules

Optional modules are said to allow for account evaluation and performance, custom letter printing, client volume, dollar analysis, volume list, label processing and multistate/municipality payroll.

Prices start at \$32,000 for a small-scale, single-CRT terminal system including the main 3CS module, a 100 line/min printer and 32M bytes of disk storage.

HDR Systems Associates is at Suite 1003, 82 N. Broadway, Hicksville, N.Y. 11801.

SRF generates performances and utilization statistics in a series of reports that include an activity log of each task and of periodic CPU utilization. Total system statistics reflect the entire measurement period as well as summaries by account, terminal and task.

SRF operates in a number of RSX-11M environments including real-time, time-sharing, process control, dedicated, general-purpose and single-user and multiuser systems. Included in its \$1,995 license fee is a one-year warranty, technical assistance, maintenance support and documentation. Gejac can be reached at P.O. Box 188, Riverdale, Md. 20840.

Package Backs MDPS Users

MINNEAPOLIS — An interactive financial accounting system for the Multiple Workstation Direct Processing System (MDPS), NCR Corp.'s multitasking operating system, is available from Open Systems, Inc.

MDPS allows NCR's 8150 small business system to operate with four terminals rather than one and two printers instead of one. Open Systems' MDPS financial accounting system lets the user execute a background task, thus releasing the CRT terminal for data entry tasks while reports are printing.

The MDPS Financial Accounting System provides application programs that can run either stand-alone or with automatic interfacing.

They include accounts receivable with billing and sales analysis, accounts payable, sales order processing, payroll, inventory, general ledger and job costing.

NCR 8150 users can upgrade to MDPS by purchasing additional memory and a processor board modification. Users of Open Systems' software on NCR's 8130 and 8150 CPUs can upgrade their financial accounting system software to MDPS and still be compatible with current data bases.

The MDPS Financial Accounting System costs \$800 on the NCR 8100 series and \$1,000 on the NCR 8200 series, Open Systems said from 430 Oak Grove, Minneapolis, Minn. 55403.

Series 80 TOTAL and Environ/1 gives us the power and versatility to handle a complex data base involving wide-ranging manufacturing applications and service a 400-terminal network with up to 85,000 transactions daily.

Instead of Making Charts Bank's Graphics Package Lets Analysts Analyze

CHICAGO — After a year and a half of diverting the energies of its cash management consultants and analysts into drawing graphs, the Cash Management Systems Unit of the First National Bank of Chicago decided to automate the procedure by using a computer graphics software system.

It did not have to go far to find one. Some divisions within the bank were already using Disspla — from Integrated Software Systems Corp. (Issco) — to draw charts and graphs for internal analyses and reports to management.

Cash Management was drawing manual graphs to support its internally generated Focus reports, which perform funds collection analy-

ses for customers, according to James C. Cupec, manager of the unit. Focus is a proprietary cash management tool the bank developed to analyze patterns that show where firms are getting and sending funds and on which banks they are drawing. Its purpose is to determine what kind of system can be produced to eliminate float, or funds in the process of collection.

Illustrations are often effective in presenting such analyses to customers. "One of the primary areas where we illustrate with Disspla is lockbox analysis," Cupec said, describing a system in which a company's customers send their payments to a post office box rather than to the company's normal

street address.

The post office boxes are separate from the company's mailing address because of the high volume of bill payments. The company's bank is also given access to the post office boxes that cuts float even lower, Cupec claimed, because the boxes can be placed in cities where customers live.

"We can use color or shaded bar charts to draw a cost comparison between a lone-lockbox system vs. a two- or three-lockbox system," he explained.

Before choosing Disspla, the First also considered Tektronix, Inc.'s Plot-10, which was rejected not for deficiencies, but because of Disspla's

added flexibility, the manager said. That flexibility included a wider selection of print fonts, the ability to create shaded bars and Issco's willingness to support its package, he explained.

Problem-Free Installation

Installation was problem-free. There have been no serious operations problems since, although some minor problems have popped up and been dealt with summarily by the vendor, Cupec said.

In one case, a typeface was discovered to have some flawed characters. In another, the bank required increased support for one of its plotters. In the first instance, a replacement font was sent out, and in the second, Issco altered the plotter to advance and cut paper automatically.

The plotter in question was one of many Hewlett-Packard Co. and Tektronix plotters running off Disspla and the bank's 3M-byte IBM 370/158. The bank will be phasing out the Tektronix printers in favor of more HP systems because the latter use a four-color pen. The Tektronix models employ only two colors, Cupec said.

In order to make Disspla more accessible to cash management employees with little or no computer background, the bank took about three months to write a front-end program that allows them to draw some line and bar charts using English-like commands instead of computer language, according to Cupec.

Other programs for specific applications have been written in as little time as two days and have been used for specific financial decisions where charts were needed to see how expenses built up over time, Cupec said.

"A publication-quality plot can be completed in minutes, rather than hours or days, and the flexibility of the system enables us to try different types of formats before choosing the one best suited to represent the statistical information," he said.

Those alternate formats include pie charts, bar charts and vertical and horizontal bar and line graphs.

SERIES 80 TOTAL. THE DBMS YOU'LL BE IMPRESSED WITH AFTER YOU'VE BOUGHT IT.

Almost every data base management system is impressive on paper. But Series 80 TOTAL is every bit as impressive in the real world of data processing operations.

Because in addition to giving you what you expect from a DBMS as a data processing specialist, it also gives you what you need as a manager.

That's not just us saying so. It's what DBMS users told International Data Corporation (IDC)—the independent research group—in the most comprehensive study of this type ever.

SAVES MAN-HOURS AND TIME

For example, IDC reported Series 80 TOTAL saves man hours two ways. First, it only requires an average of one person spending half his time to support the system. That's one fourth the people required by another leading package which needed four people on average and sometimes as many as 12. Unlike another leading package, Series 80 TOTAL was reported up and running right on schedule, not behind it. And unlike two other major packages, Series 80 TOTAL users were completely satisfied with its fast response time in actual operation.

EASILY ADAPTS TO CHANGE

It stands to reason that the more useful a DBMS is to management, the more they'll use it. According to the IDC survey, users integrated Series 80 TOTAL into an average of 41% of all applications. That's more than any other DBMS and almost twice as much as the next leading system.

That's because with Series 80 TOTAL's powerful data structuring capabilities almost any data relationship can be rapidly and easily defined.

And, as your business needs change, Series 80 TOTAL's modular step-by-step development capabilities are flexible enough to be adapted to change, quickly and economically.

You can add new data, new functions, even new applications without having to scrap, update, maintain or rewrite a dozen existing programs for every new one.

KEEPS ALL ITS PROMISES

Many DBMS packages promise to do everything we have just told you Series 80 TOTAL does. But when IDC asked DBMS users how they'd change their present package, Series 80 TOTAL was the only one of the three leading systems to emerge with a clean bill of health.

None of this is the least bit surprising. Because many of the new features and facilities that have made Series 80 TOTAL so successful come from more than 3,000 users who have used Series 80 TOTAL in almost half their operations over the last decade.

The end result is a DBMS that easily accommodates distributed processing, data base machines, even migration to the new IBM 4300 (because it supports VSAM) and TIS, Cincom's revolutionary new Total Information System. So, if you don't want to take our word, take the word of the users IDC surveyed.

Fill in the coupon below, or call Dennis Yablonsky, our National Sales Manager at (513) 662-2300 and we will review all the pertinent details of the IDC study. You will learn how Series 80 TOTAL has been designed and engineered for the 80's.

Contact us now, because the best time to find out how well a DBMS will do after it's installed, is before you buy it.

Please bring me proof of why Series 80 TOTAL outperforms the competition.

DOS/VS Terminal Printer Spooling BIMSPool

Retrieves batch print from POWER/VS queue, converts and prints on 3270-type terminal printer via CICS*. May be used to eliminate RJE printers. \$4000 or \$200/mo.

DOS/VS Console Hard Copy File Display BIMDSLOG

Used by operators or programmers to review DOS/VS messages via CICS* without tying up system console. \$720 or \$36/mo.

*Now available for SHADOW also.

DOS/VS(E) System Status and Queue Display BIMMONTR

The original and still best DOS/VS(E) system activity, performance measurement, POWER/VS queue, and POWER/VS job output display system. (CICS) Numerous options to assist operators, programmers, and systems programmers. \$920 or \$46/mo.

BIMB I MOYLE ASSOCIATES
4355 LYNDALE AVENUE SOUTH
MINNEAPOLIS, MN 55408
(612) 822-2661

DOS/VS(E) and CICS/VS Consulting, Contract Systems Programming, and Program Products.

When IBM introduced their 3278 display, it was a good solution to some very challenging problems. And anything else developed along those lines would just be a copy. Well granted, we were impressed. But when we decided to tackle the same job, we came up with a few exciting twists of our own.

Our new Plus 80 display, Model 8078, is a completely plug-compatible 3278 terminal for use with IBM's 3274 and 3276 controllers.

The 8078 display is used in clusters of up to 32 devices for the processing of alphanumeric data with the IBM S/360, S/370, 303X, 8100, 4300 computers and the 3790 communication processor. Clusters may use both IBM and Trivex display stations and printers.

The Plus 80 offers everything IBM has

to offer and a few extras. Like a switch that allows the program pad to act as a 10-key adding machine. Internally stored diagnostics are built in for both user and Trivex Field Service fault isolation.

Diagnostic routines have been greatly simplified for the operator. The unit is designed to test the functions of the display at power-up, before automatically switching to on-line mode.

As options, you can specify a security lock, lite pen and enhanced typamatic speed.

Further, the Trivex 8078 display has the same excellent reliability (MTBF of over 5,000 hours) and maintainability of its Plus 70 predecessor (15 min. MTTR).

So call Trivex now.

You can get this year's features this year and at a price you can't duplicate.

MDS

TRIVEX, INC.
a Mohawk Data Sciences Company

Introducing A Copy More Valuable Than The Original.

Survey by VDC Finds Users Favor 80-Column CRT Displays

By Bruce Hoard
CW Staff

WELLESLEY, Mass. — Eighty-six percent of alphanumeric CRT terminal users favor 80-column by 24-row displays, and terminals with those characteristics will continue to dominate the marketplace for at least the next five years, according to a recent survey by Venture Development Corp. (VDC).

The survey also found that

"smart," editing CRTS are the most popular among users.

The 80-column display has become standardized to the point where only 5% of the users surveyed prefer displays with fewer than 80 columns and 9% prefer more than 80.

Although IBM, Digital Equipment Corp., Datamedia Corp., Datagraphix, Inc. and others offer CRT terminals with 132-column displays, the popularity

of their offerings has not lived up to expectations, the study reported. Nevertheless, VDC predicted other vendors will soon manufacture the expanded displays.

"One of the advantages of a 132-column format is its ability to approximate the size of a printer so data can be displayed as it is printed," a VDC spokesman said. "The extended screen is also useful for coding, debug-

ging and maintaining software."

On the negative side, electron beams must travel further from one side of a 132-column screen to another, leaving the door open for more distortion, he noted.

Other problems he mentioned included the added expense of higher quality monitors and the need for larger power supplies.

Dedicated applications such as data entry, inquiry/response and order entry do not require 132-column displays and users just are not willing to pay extra money to obtain a feature they feel has only marginal value, the study suggested.

MDS Unveils 'Office of Present'

Brad Schultz
CW Staff

DETROIT — The "office of the present" — not the future — is the target of an integrated DP, word processing (WP), electronic mail and network management service unveiled at the recent International Communications Association (ICA) convention here.

The Worldwide Integrated Communications (Winc) service from Mohawk Data Sciences Corp. (MDS) allows an organization to give intelligent terminals in its domestic and international facilities both data- and text-oriented functions, a spokesman said.

The typical user would be a large company with more than \$200 million in annual revenues and at least 10 branches.

Many users are not ready for so-called "office of the future" products, which require extensive equipment acquisitions and readjustments of personnel, the spokesman observed. But MDS thinks many organizations are demanding something like Winc right now — a service based on the vendor's Series 21 terminal family and an electronic mail service (EMS) that Wiltek, Inc. of Norwalk, Conn., has sold for seven years.

Winc ties to the TWX and Te-

lex public networks as well as to the U.S. Postal Service, but is meant to replace those media at less cost, the MDS spokesman

be routed to or from user work stations at 1,200 bit/sec.

The communications service "is geared to large companies that presently have a leased-line teletypewriter-based network or are heavy-volume TWX or Telex users."

Besides the Series 21 intelligent terminals, which can support a wide range of DP, text-oriented and network management tasks, MDS models 300 and 400 message terminals and the vendor's Plus-70 and Plus-80 editing terminals are adequate for Winc applications limited to correspondence and document generation, the spokesman indicated.

(Continued on Page 82)

More Characters Sought

Users did express a desire for more characters per display, however, but indicated they should come through additional rows and not columns. The increasingly common integration of word processing and conventional DP is the driving force behind that attitude, the study surmised.

A 25th row is becoming more widely accepted. It is used primarily for monitoring system status and control rather than displaying data, according to the survey report. "Alphanumeric CRT Terminals: A Strategic

(Continued on Page 82)

CW
At ICA

said.

Typically, Winc traffic will be time-critical, requiring delivery in a time frame ranging from 15 minutes to overnight, he added. A Winc message unit (600 characters) will usually cost less than a postage stamp to deliver, according to MDS estimates, and

Tyme-Gram Makes Formal Bow

By Phil Hirsch
CW Washington Bureau

DETROIT — Tyme-Gram, a low-cost electronic mail service (EMS), was officially unveiled by Tymnet, Inc. at the International Communications Association's recent annual conference here.

Tyme-Gram service will begin Sept. 1 and encompass 30 cities, Tymnet said. Rates will range from a low of 30 cents for next-day delivery of a one-page, 1,500-character message to a high of \$1 for such a message under the proposed tariff.

Western Union Telegraph Co.'s comparable charge for Mailgram service, according to Tymnet, is \$1.92.

Startup of the Tymnet EMS on Sept. 1 is dependent on approval of the tariff by the Federal Communications Commission. That approval could be delayed by objections from numerous competitors. Besides Western Union, the competition includes GTE Telenet Communications Corp. which, like Tymnet, operates a nationwide public packet-switched network. The Telenet offering, also recently announced,

MDS Unites DP, WP, EMS, Net Services

(Continued from Page 81)

In EMS mode, Winc lets users communicate outside their network through TWX, Telex, Western Union Telegraph Co.'s Mailgram and international common carriers such as ITT World Communications, Inc., RCA Global Communications, Inc. and Xerox Corp.'s Western Union International.

The service automatically polls each terminal in the network, collecting messages or data to be delivered to other terminals. The user can select the polling interval, so locations with heavy traffic demands can be polled every 15 or 30 minutes, the spokesman said. Other sites might be polled at intervals ranging from hourly to twice daily.

Wilek's Norwalk headquarters oversees Winc operations. There, multiple computer systems poll individual terminals over phone lines, store and route messages and data and monitor the network's performance, the spokesman explained. MDS bought all rights to Wilek's products and services earlier this year.

Data entry will be a major distributed processing application of Winc. At field locations, a user's inventory records, payroll information and customer orders can be entered, edited, formatted and verified on Series 21 terminals. While the terminal awaits polling, the information can be stored in its internal floppy disk unit.

According to the spokesman, the Wilek computers in Norwalk convert messages and data to the formats and protocols supporting their destination.

The Series 21s adhere to IBM 2780 bi-synchronous protocol, another spokesman stated.

"Any [EMS] should duplicate, step by step, the procedure of sending a letter through the U.S. mail," the first spokesman declared. "That means it should have the ability to write the correspondence and check it for errors, provide an 'envelope' to put it in, stamp it, supply a 'mailbox,' collect the mail at scheduled times, take it to a 'post office' where the stamp is canceled and deliver it promptly."

Winc reportedly does just that. The Series 21's WP capability can generate and edit the correspondence, he maintained. The MDS service supplies mnemonic addresses — such as "NYC" for New York City — and the floppies within the Series 21s serve as "mailboxes."

Message charges are 15 cents per message unit for express service, which delivers a message to a location as soon as that location is polled, and 6 cents per message unit for overnight service. Those rates decrease to 10 cents and 4 cents, respectively, for "high-volume" users, the spokesman said.

Winc vs. TWX

MDS released a cost comparison between Winc service and TWX service for a network with 50 nodes, each sending 20 messages daily and having an average of two destinations per message.

On that basis, Winc would cost \$22,758/mo and TWX would cost \$26,800/mo, MDS claimed.

MDS is headquartered at 1599 Littleton Road, Parsippany, N.J. 07054.

"I'll pay your IBM maintenance bill"

I'm Bob Rich, General Manager of Computer Maintenance and Leasing Corporation.

A few years ago we had an idea that has changed the way a lot of people think about computer maintenance.

The idea is a simple one: you don't have to sign an IBM Maintenance Agreement in order to get IBM service, parts and personnel.

When you purchased your IBM system, you were given a choice of two maintenance plans:

IBM Maintenance Agreement — where you pay a fixed monthly fee for all normal services as needed.

Per-Call — where you pay an hourly charge up to \$76 plus parts, plus travel, portal to portal.

We at CMLC will provide you with a comparable maintenance agreement for considerably less. You get the same service from the same IBM engineers using the same IBM parts. But then IBM bills us at the per-call rates.

In other words, you get the security and budgeting control of the IBM Maintenance Agreement, at significant savings, and we promptly pay all the IBM bills.

Furthermore, we offer increased services, such as extended hours of maintenance coverage... 11 hours per day, versus 9 hours under the standard IBM Maintenance Agreement... mechanical replacement of "problem" machines and a complete preventive maintenance program.

Sound too good to be true? If you're one of those people who don't believe that it's possible to get more for less, call us toll-free at:

1-800-328-3655

(In Minnesota, call 612-473-3608 collect)

We'll give you the names of people in your area who have found that it's more than possible. It's simple.

Users Say They Prefer 80-Column CRTs

(Continued from Page 81)

Analysis.

The report broke the installed base of alphanumeric CRT terminals down to three categories and said IBM has a 23% overall share of them.

The first category is conversational, or "dumb," CRT terminals, which VDC explained were originally designed to replace the teletypewriter. They comprised 23% of the 1978 installed base.

Dumb terminals are not programmable, contain no storage buffer, cannot insert lines of copy and communicate with a computer one character at a time.

Editing — "smart" — CRT terminals are the second and most prominent category mentioned in the report. They were broken into two subdivisions: IBM 3270 and compatible and non-3270-compatible. Of the installed base, 31% fell under the former category while 26% were non-3270-compatible.

Distinguishing characteristics of this category include read-only memory (ROM) and programmable ROM; however, the report said, these smart terminals are not user-programmable. They can store data, send it to a computer and insert characters or lines

without computer assistance.

The third category mentioned by the report was processing CRTs. Although connected to a larger computer, they are capable of performing several stand-alone tasks.

Two subdivisions were also broken out here: single-station (6% of the installed base) and clustered processing (15%).

These terminals are user-programmable, process data locally through random-access memory and high-level languages and can drive pe-

ripheral devices such as printers and floppy disks.

VDC predicted the installed base of alphanumeric CRT terminals will grow at a compound rate of 21.6% over the next five years, resulting in 4.5 million units being installed by the end of 1984. At the end of last year, 1.7 million were in place, the consulting firm noted.

Initial copies of the study cost \$1,495 and additional copies sell for \$149.50. VDC is at 1 Washington St., Wellesley, Mass. 02181.

The Madzar Z9600. The Z that out performs any other modem for all your short haul trips around town. We're so positive you'll agree, that it's yours on credit approved 30-day free trial. And this is what you'll get:

SUPERIOR

Some say their products are superior. Others prove it.
And Graham products have been proving it for years. The success
of our famous Epoch 4 is the premier example.

Now we've combined the superior modulus of toughness of the
Epoch 4 binder with our larger Magnum 80 particle. The result? Epoch
480. A computer tape that's smoother and more uniform than Epoch 4.
A tape that makes possible even greater reductions in head and tape wear.

If you've been tempted by today's economics to try something
other than Graham tape, come back.

You'll find Epoch 480 even better than Epoch 4.

If They Conform, So Will IBM

IBM's X.25 Adoption Seen Hinging on Carriers

By Brad Schultz
CW Staff

DETROIT — Domestic carriers must conform to the proposed X.21 and X.25 international standards before IBM will allow its users in this country to adapt terminals to conform with those recommendations of the Consultative Committee on International Telephone and Telegraph (CCITT).

While data communications managers from many large U.S. firms met here recently at the International Communica-

tions Association (ICA) Conference and discussed their need for internationally acceptable facilities, spokesmen for IBM hinted that X.21 and X.25 must win AT&T's approval before the largest DP vendor gives the protocols to domestic customers.

IBM support of X.25 was hinted at by Dr. Louis M. Branscomb, IBM vice-president and chief scientist, at the ICA conference. "It is IBM's objective to provide the capability of attaching selected products to public data net-

works with [the] X.25 . . . interface," Branscomb said during a speech on "Computer Technology in the '80s" [CW, May 19].

IBM users in the U.S. have looked to the giant vendor for signs that it endorses the proposed CCITT standards for terminal-to-network links, which already apply to most data traffic in several foreign nations. Last December, IBM told Japanese users they would soon have X.21-based services through certain Systems Network Architecture (SNA) products that interface with Nippon Telegraph and Telephone networks.

IBM has also released products that adapt users in Canada, West Germany, France

and The Netherlands to X.25.

According to a written "statement of direction," the vendor "encourages the use of international standards as the basis for interfaces to public data networks providing circuit-switched, packet-switched and leased-circuit services."

IBM customers deserve X.21 and X.25 ties because the protocols "provide users with new alternatives for transmission that supplement the functions provided by [SNA]," the statement read.

No Word From Branscomb

But Branscomb balked at a chance after his speech to flatly predict that U.S. customers will get the compatibil-

ity. Much depends on the course taken by AT&T, he told the press.

IBM feels it must stay compatible with Bell network facilities, the former National Bureau of Standards director explained.

The recent Federal Communications Commission decision to deregulate Bell's purely DP operations was welcomed at IBM headquarters, Branscomb observed.

The commission's flirtation with regulating the DP marketplace worried IBM management, he said, although the objective was to keep Bell from capsize smaller data communications suppliers as the company plunged into the marketplace they serve.

Tyme-Gram Makes Formal Bow

(Continued from Page 81)
is called Telemail.

The rate for each Tyme-Gram will be distance-insensitive, varying according to the number of messages the customer sends each month. A message is defined as one page containing a maximum of 1,500 characters. For the first 2,500 messages, the charge is \$1 per message. For the next 5,000, the rate is 75 cents each.

It drops to 50 cents for each of the next 7,500 messages, to 37 cents for each of the succeeding 35,000 and to 30 cents for each additional message after that.

The cities to be included in the initial Tyme-Gram service are the 30 largest in the nation. They include Charlotte, N.C., Tampa, Fla., Portland, Ore., and Phoenix.

Route of Messages

Tyme-Gram messages can be input through a wide variety of dumb and intelligent terminals ranging from teletype-writers to computers and including on-line mass storage devices such as magnetic tape and disk units. The messages are transmitted in binary form to a Tymnet computer which arranges them in Zip Code order, then dispatches them to each distant city.

There, high-speed equipment converts the messages to hard copy, folds each one and places it in a distinctive envelope. The messages are then taken to the local central post office by a specified time each day and are delivered to the recipients the next day by U.S. Postal Service letter carriers.

Test Results

In some destination cities, Tymnet will use its own facilities and personnel to process Tyme-Gram and deliver them to the post office; in others, the company plans to contract

this job out to commercial mailers.

Although next-day delivery is not guaranteed, Tymnet President Bob Harcharik reported that a preliminary test of Tyme-Gram in San Francisco and Los Angeles "shows that we can achieve next-day delivery in over 90% of the cases."

Among the companies participating in the test was Shell Oil Co., which played a leading role in persuading the U.S. Postal Service to develop Elec-

tronic Computer-Originated Mail (Ecom), a service similar to Tyme-Gram.

Ecom, however, has been delayed and possibly aborted by opposition from commercial EMS vendors and others.

According to Harcharik, Tyme-Gram's lower-than-Mailgram rates will make Tymnet's service cost-effective for many new applications. He mentioned sales canvassing and fund-raising as examples.

Geller Sees 'Good Chance' Rewrite of 1934 Law Will Happen by End of '80

By Phil Hirsch

CW Washington Bureau

DETROIT — There is "a good chance" Congress will enact new national telecommunications policy legislation this year.

That is the opinion of the President's chief telecommunications adviser, Henry Geller, who heads the National Telecommunications and Information Administration. Geller was a featured speaker here last week at the annual conference of the International Communications Association (ICA), a

CW At ICA

users group composed primarily of communications managers employed by the nation's largest companies.

Geller was even more specific when he met with the press after his address. He said the chances "are about 55%" that Congress will deliver a revised version of the 1934 Communications Act to the President by the end of this year. "And if it doesn't happen this year," he added, "the chances of doing so next year are even better."

Not everyone agreed. Westinghouse Electric Co.'s Robert E. Bennis — who heads an ICA committee that has been playing an active role in the legislative drafting process for the past two years — said he thought Geller was being optimistic.

But AT&T Board Chairman Charles Brown, who gave the ICA keynote address, said he was "encouraged" by recent developments on Capitol Hill. He specifically mentioned a proposed amendment to H.R. 6121, the House of Representatives' version of the Communications Act rewrite bill offered late last month by Rep. James Broyhill (D-N.C.). Broyhill has generally reflected AT&T's views in the policy debate.

The Broyhill amendment is considered to be a breakthrough by at least some observers because it gives AT&T's competitors — particularly those within the computer industry — a concession they have been demanding ever since the policy debate began four years ago. Specifically, the Broyhill amendment would require AT&T to transfer the manufacture of intelligent on-line terminals to a subsidiary that would be fully separated from Western Electric. That subsidiary, rather than Bell Labs or Western Electric, would have to conduct all research and development related to competitive services.

Neither of these changes could occur until at least six years after enactment of the legislation — one of several qualifications that bother many of Bell's competitors.

But, Geller said in an interview following his ICA speech, despite this concern there has been substantial progress within the House subcommittee in developing legislative language to implement the Broyhill proposal.

When this effort started about May 1, there were "15 issues to be re-

solved," he reported. At the beginning of last week, "all but four of them had been settled."

'Lawyers' Paradise'

In his speech, Geller pointed to a growing realization that further delay in modernizing the Communications Act of 1934 will create a "lawyers' paradise" in which the courts wrestle endlessly with the underlying issues. Telecommunications technology is changing too rapidly to permit such delay, he said.

Robert Bennis, who spoke shortly after Geller, reflected this same thought when speaking about the need to "unleash the full range of [telecommunications] technology now, rather than after a court decision" so users can exploit the benefits.

Geller pointed out that even if acceptable language embodying Broyhill's proposal is drafted, H.R. 6121 would still face several challenges before it could be enacted.

But, he contended, if the amendment is accepted by three key members of the House Communications Subcommittee — Tim Wirth (D-Colo.), Broyhill and Chairman Lionel Van Deerlin (D-Calif.) — the subcommittee will report the bill to its parent, the House Commerce Committee.

Once this happens, he claimed, the committee will approve it "quickly", as will the full membership of the House.

Geller also predicted that the Senate, which has drafted two versions of legislation to replace the '34 Communications Act without having reported out either, will "move into high gear" as soon as the House Subcommittee acts. Although the Senate and House versions of the rewrite differ in key respects, he does not believe this will be a problem once the legislation starts moving.

Xerox Enhances 1350 Terminal

LOS ANGELES — Multiple terminal and communications capabilities have been added to Xerox Computer Services' Model 1350 intelligent terminal.

Users can now connect up to four additional terminal workstations to the 1350, selecting a combination of CRT and hard-copy equipment to meet their requirements, according to the company, part of Xerox Corp.

A typical 1350 system consists of a CRT keyboard terminal, a 200 char./sec matrix printer and a microprocessor control unit with four floppy disk drives for information storage. By adding communications capability to the package, users will be able to perform several functions simultaneously, including sending and receiving data, Xerox said.

Purchase price of the 1350 is \$15,000, with software costs of \$135/mo. Prices for multiple terminal systems vary depending on configuration and user applications, the vendor said from 5310 Beethoven St., Los Angeles, Calif. 90066.

The Ohio Scientific C2-OEM is a typical microcomputer at a special price!

The Ohio Scientific C2-OEM is designed for business and industrial applications which can effectively use typical microcomputer speeds. But, that's where its similarity to others in its class stops.

- Full business configuration — standard.
- 48K dynamic RAM
- .35 MIPS 6502 CPU
- RS 232 port at 300 to 19,200 baud.
- Dual 8" floppies store 800Kbytes.
- OSI BUS oriented for modular expansion.
- Two slots in base machine; six open for expansion.
- Fast low overhead disk operating system — standard.
- Microsoft BASIC with random and sequential access files.
- Instant load disk bootstrap and front panel emulator in ROM.

\$2799

The C2-OEM cabinet can be table top, rack mounted or incorporated in a matching desk which will accommodate a CRT terminal and printer. Industry standard parts provide very reliable operation and easy service. And best of all, the C2-OEM can make use of most of the business application software and accessories for the popular, premium performance Ohio Scientific Challenger III.

Available in OEM quantities at attractive discounts.

Microwave, Too, NTIA Chief Says Geller Sees Cable TV Replacing Local Loops

By Phil Hirsch

CW Washington Bureau
DETROIT — The use of cable TV and microwave in place of local-loop circuits provided by the telephone company will become widespread in the 1980s, Presidential telecommunications adviser Henry Geller predicted here recently in a speech to the annual conference of the International Communications Association (ICA).

About 20% of all U.S. households are now accessible via cable; by the end of this decade, the percentage will be at least 33% and possibly as much as 50%, Geller said.

Meanwhile, systems with

greatly increased transmission capacity are under development. Geller, chief of the National Telecommunications and Information Administration (NTIA), reported that in Atlanta and Pittsburgh, Pa., plans for 80- to 85-channel networks have been announced. In New York City, a system providing more than 100 channels is planned.

Typical cable TV systems presently in use have 20 to 30 channels. Xerox, which last year announced plans to offer an electronic mail service called the Xerox Telecommunications Network (Xten) supported by satellite or terrestrial broadband intercity transmission channels linked to the user's premises by microwave local distribution circuits, is one of a number of suppliers already planning to use these new facilities. Videotex and teletext services — which utilize home TV sets to deliver a wide variety of information on-line to homes and offices — represent another application.

Preventing Exodus

The federal government probably will have to limit the number of new local-loop offerings "for some time" to prevent a mass exodus of subscribers from telephone company-provided facilities and a resulting increase in rates for local telephone service, Geller said. Among the other problems posed by the convergence of TV and data transmission technologies is whether to regulate cable TV system operators and how to interface their networks with the telephone network.

NTIA is currently working in both of these areas, Geller said. The Carter Administration is also trying to curb government competition with commercial vendors of on-line services, he added. It has tried to persuade the governors of the U.S. Postal Service that the post office's proposed Electronic Computer Originated Mail (Ecom) should be scaled back so carriers transmit messages and the Postal Service performs message-conversion and delivery functions; but the governors have not yet decided whether to accept this advice.

Meanwhile, the Federal Reserve Board has established a network of automated clearing houses for the nation's banks, thus providing a service which competes with commercial offerings. A Presidential task force is now "looking at this problem," Geller said. He noted that the Carter Administration agrees with a recent recommendation to Con-

gress from the Federal Communications Commission (FCC) which endorses the idea of letting Communications Satellite Corp. (Comsat) serve end users directly instead of through leasing its international satellite circuits to other carriers. But Geller said any such change should assure that other carriers providing end-to-end international services will have access on non-discriminatory terms to Comsat transmission facilities.

Growing Concern

Within the next six months, Geller expects the Organization for Economic Cooperation and Development, representing all of the major industrialized nations of the world, to approve privacy guidelines that largely follow U.S. recommendations rather than the more restrictive rules proposed by European countries. But on a related front, Geller indicated growing concern.

Other countries are continuing their efforts to shift data communications users from leased private-line circuits which allow full utilization of the related transmission capacity to "volume-sensitive" tariffs covering facilities priced on the basis of usage.

In each case, Geller said, the effect if not the intent is to erect a nontariff trade barrier designed to protect a country's suppliers of domestic infor-

mation services against foreign — generally U.S. — competition.

Japanese Curbs

Japanese restrictions on the use of their private-line circuits by U.S. time-sharing companies represent one example of this problem, Geller indicated. The restrictions require each circuit to terminate at a single specified computer in the U.S.

Since the affected U.S. companies — Tymshare, Inc. and Control Data Corp., among others — distribute their application programs and data bases among a number of locations, the result is a sharp reduction in the remote computing services they can market in Japan.

Alternatively, the Japanese — together with U.S. international record carriers — have begun offering international "data base access" circuits priced at volume-sensitive rates, which are free of termination restrictions. These offerings were recently authorized by the FCC despite strong protests from U.S. time-sharing companies, whose basic objection is that the new facilities, besides costing more than present full-period leased circuits, also are less efficient because they cannot be modified to accommodate proprietary protocols and other types of customizing.

Brown Sees Technology Solving Economic Ills

By Brad Schultz

CW Staff

DETROIT — Computer technology may bail the nation out of its economic quagmire, Charles L. Brown, AT&T's board chairman, told the International Communications Association (ICA) here last week.

That is how Bell overcame a productivity slump of its own about 10 years ago. Administrative software systems gave the giant telecommunications supplier tighter controls over its diverse operations and reduced the number of Bell employees needed to serve each 10,000 telephones from about 80 in the years 1968 through 1970 to 60 employees in 1980, Brown said in the ICA convention's keynote address.

Bell now runs more than 300 administrative systems to aid the design of switching centers and configure the cables and trunk lines that interconnect them. Such systems "have an enormous potential for improving productivity in a great many businesses," Brown said.

The nation's companies will be increasingly dependent on telecommunications networks in the years ahead and, therefore, will be more productive as computer technology raises the efficiency of those networks, he predicted.

'Next Age of Discovery'

"We meet in an uncommonly cheerless time so far as the economy is concerned," the AT&T chief told ICA. But the convergence of computer and communications technologies may usher in the world's "next age of discovery."

It may also usher in Bell's next age of rapid fiscal growth. The firm has taken "dead aim" at the "information market," Brown declared, and gained confidence from the Federal Communications Commission's (FCC) recent final ruling in Computer Inquiry II — an examination of whether Bell should be allowed unregulated entry into the DP marketplace.

The FCC decided to relinquish jurisdiction over the purely DP-oriented offerings of Bell and other communications vendors starting to address computer users. However, Bell continues to face a major antitrust action lodged by the U.S. Justice Department as well as proposed revisions of the 1934 Communications Act.

Both the judicial and legislative actions turn on charges that Bell gives its DP operations unfair advantage over many independent DP vendors because Bell's DP operations allegedly get a large share of revenues from the holding company's massive telephone business.

After more than two decades of debate, the fundamental issue is not whether competition

**CW
At ICA**

or regulation should govern telecommunications, Brown stated. Instead, Congress should designate "once and

for all" those areas of the industry that warrant regulation and those in which competition is appropriate.

New legislation is especially desirable because the FCC's authority to sanction direct competition between AT&T and DP vendors may be vigorously challenged in the courts, according to Brown. However, the "information age" is an inevitable result of technological progress that

cannot be managed by regulatory fiat, he said.

Bell plans to accelerate its implementation of digital technology in the public switched network, working toward all-digital links among residences as well as businesses. To improve customer responsiveness, Bell is phasing in a Customer-Oriented Measurement System, Brown continued.

The system involves apply-

ing the user's response to a four-page questionnaire to Bell's analysis of the user's needs.

In an interview after the speech, Brown said the nation's current economic recession has hurt some areas of the telecommunications industry. On the other hand, it may be prompting some users to upgrade certain resources because of urgent demands for productivity enhancement.

Installs up to 500 feet from your CPU

No "attachment controller cards" to buy
Because they're already included — ready for easy direct connection to the I/O bus of your Series/1 processor.

Should you choose a minicomputer on the basis of the peripherals available for it? We think so, because it's the peripherals that people actually work with every day. And because the whole peripheral package usually costs more than the processor itself.

That's why we've engineered so much performance and value into our Certainty Series — an entire family of products designed around the Series/1.

Cost conscious? Our Certainty 420 Matrix Printer is the economical alternative.

Not all Series/1 applications need the more costly band or line printer technology, but all need the printing quality delivered by our Matrix Printer. It's loaded with extra features and options, too. You can

use one- to five-part forms from 4 to 16 1/4 inches wide. Compressed pitch as well as all character variations are under software control and are easily changeable. The print ribbon cassette snaps on-and-off easily. Forms load from the rear, but for even more versatility a bottom forms feed model is available. And all of this locates up to 500 feet from your Series/1 CPU.

Yes, we've engineered a lot of customer convenience and versatility into our Certainty 420 design, to give you a lot more than a basic matrix printer for your money.

You won't have to worry about service, either. More than 4,800 Customer Engineers in our worldwide maintenance organization support our products.

Available Now

Our Certainty 420 Series is ready to help you get optimum performance and ease of operation from your Series/1. For data sheets and more information, call today, toll-free. 800/328-3390.

CD CONTROL DATA CORPORATION

Addressing society's major needs

DIGITAL INTRODUCES THE MOST AWESOME ARRAY

At Digital, network technology has just taken another giant step.

Announcing Phase III networking: a host of new capabilities that will make your computer power easier to allocate, easier to control, and easier than ever to justify to your management.

With Phase III, your options have never been greater. Or more cost-effective. As always, you can match the right Digital system to the right local job. But now, you can network those systems virtually wherever, whenever, and however you want. Even when your mix includes another manufacturer's mainframe.

And no matter how you network, you'll be doing it in the most economical way possible. Just consider these new capabilities.

SNA Protocol Emulator.

Now Digital systems can talk to and support IBM mainframes using the SNA protocol. Thus, you can protect an investment in hierarchical networks, even as you commit to more flexible distributed systems.

Adaptive Routing. Now Digital networks can automatically find the least expensive path between two nodes. Not only that, they automatically re-route information around problem areas. Your line costs are held down.

And your data is never held up.

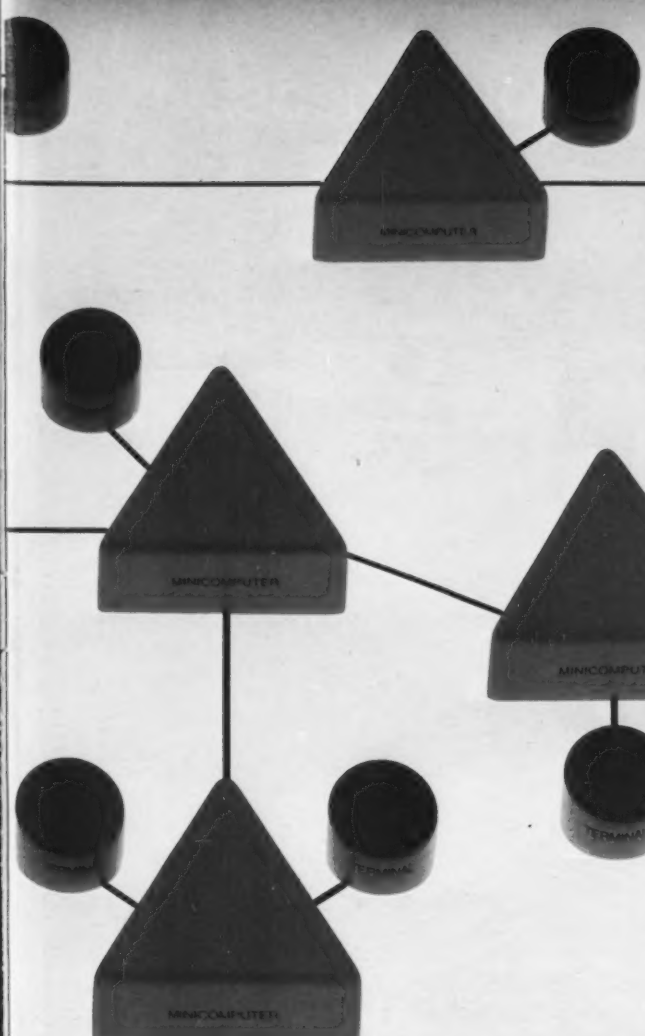

Multipoint Communications.

Now one communication line can serve several Digital nodes simultaneously, reducing your line costs considerably.

Network Command Terminals.

Now a central management group can program and control an entire network from one command terminal,

PHASE III. OF NETWORK OPTIONS EVER.

public packet switching networks
using the X.25 protocol.
Digital Packetnets are
currently being tested

and certified in the U.S.,
Canada, and France.

More flexibility. More control.
And the most cost-effective ways
to achieve them. Add these new
Phase III capabilities to the already
formidable array of Digital

networking options, and
you have the elements of
an awesome network.

But then, that's
just what you'd expect from
Digital. Innovative technology.
And the leadership to put it to work.

thus cutting the cost of program-
ming individual nodes in widely
dispersed locations.

Enhanced Network Management.

Now you can add on systems,
change communication links, gather
operating statistics, and detect
problems, all without shutting down
the network. Imagine the savings
on downtime and expansion costs.

X.25 Packetnets. Digital is
firmly committed to supporting

DOCUMATION IMPACT 3000 Series

The Upgradeables ...printers that grow with your needs.

Documation fights the high cost of obsolescence by offering a complete line of high performance field upgradeable printers.

With the IMPACT 3000 Series, you start with just the throughput rate you need today: 1550, 1800, 2250, 2600 or 3000 lpm. And then upgrade to the level you need later — up to 3000 lpm. Right in your own computer room, and in less than half a day.

Field upgrading can meet either temporary or permanent peak load requirements. Either way you've got a printer that is more responsive to your changing needs.

The 3000 Series is a more cost effective buy because you always have a printer that's as up-to-date as the day you bought it.

Convenience features

Documation's IMPACT 3000 Series printers are engineered for operator convenience with features like:

- a power operated hood with manual override
- fully automatic microprocessor controlled power stacker for a variety of user forms
- an interchangeable 432-character print band, coupled with the Universal Character Set Buffer, that allows character sets and font styles to be easily changed in less than a minute

Publishes Monthly Tabloid Alternate Burroughs User Group Forms

By Marguerite Zientara
CW Staff

AUSTIN, Texas — An independent, profit-oriented Burroughs Corp. user group was started here last December in an attempt to offset Burroughs' traditional "no advertising, no publicity" policy that allegedly resulted in "frustrated" users who lacked needed information.

Established by several Burroughs users who still work for other companies, BWI, Inc. maintains a full-time staff of seven people, all of whom have "some Burroughs experience and are aware of the issues faced by Burroughs users," BWI Vice-President Tom Clark explained.

With a stated objective of establishing a regular communication vehicle among Burroughs computer sites, BWI publishes a 24-page (and growing) tabloid called *BWI Monthly*, the advertising in which "pays a lot of the bills," Clark said.

The 2,000-member association is basically "pro-Burroughs," Clark explained, but will use its publication as a forum to air both positive and negative issues of interest to users. "We're not going to whitewash issues in the publication just to make Burroughs look good, but we all have a lot of money invested in Burroughs computers and it's in our best interest to maintain a positive relationship with Burroughs."

While BWI is not affiliated with or sanctioned by Burroughs Corp., Burroughs does sponsor its own user group. "They meet twice a year, and actually a small percentage of Burroughs users attend those meetings," Clark claimed.

"What we're offering that we think is a little different and attractive to the Burroughs

users is a monthly publication dealing strictly with Burroughs-oriented issues, so people can get news about Burroughs often without having to go to those semiannual meetings."

BWI will not be having large national meetings, however. Instead, the group will help smaller, local groups establish themselves. "In areas where there are not local groups, one of the things we're trying to do is to help those local users get organized and tell them such things as how to conduct meetings and how often," Clark said.

Burroughs' Stance

While Burroughs now looks on the group "favorably" and thinks it's "a good idea," according to a Burroughs spokesman, its initial reaction to the concept was a bit more guarded, BWI's primary organizer, James C. Boon of Boon-Chapman Insurance Managers, said here.

"Burroughs management tried to discourage us by telling about similar efforts that had failed in the past because users were too apathetic to participate," Boon recalled, adding, "I can understand that, because those previous attempts were done using voluntary help."

"I think our members will appreciate that we are running this association like a business," he suggested. "The stronger we are financially, the more beneficial our services will be."

Besides the monthly journal, those services include a software exchange service, cooperative buying, a free telephone consulting service and information about foreign equipment interfaces.

The group will also act as a personnel

clearinghouse. "We find that technical people who like to work on Burroughs computers are not quite as available as IBM-oriented technical people," Clark noted, "so we try to match Burroughs technicians' resumes with job orders from installations."

In addition to the free telephone consulting service, BWI also has three people available for on-site in-depth consultation aimed at specific problems, in which case the service would not be free.

Furthermore, "We have established a limited marketing arrangement," Clark explained. "For example, if a Burroughs user has developed a particular software package in the insurance business and wants to recover some of his investment by selling it to another user, we'll do the marketing promotion for that package."

"If the developer then in fact sells that package to another user because of our efforts, then we'll collect a broker's fee on it."

Direct-Mail Solicitation

How does BWI attract members? Through direct-mail solicitation, according to Clark. "Over a four-month period, we bought mailing lists from anybody who purported to have a list of Burroughs users for sale."

"We merged and sorted and now we have what we feel is a very complete list of 11,500 Burroughs users. We've done several direct-mail solicitations to that user base, explaining who we are and what we're trying to do. We've sent our publication throughout the user base, too."

"One of the things we're finding a challenge is that Burroughs is out there selling all these new users equipment," Clark noted. "It's quite a hard task for us to keep up with who the new users are."

Once BWI finds out about a new user, however, a 500K-byte Burroughs B2800 CPU helps keep track of each one, Clark said. He stressed that BWI is not limited to Burroughs users only, but is open to "anyone who is interested in Burroughs."

Future plans for BWI include expansion to offering the same services for users of other vendors' products, Clark said. "We've found the trade publication aimed at a specific vendor's users has been very well received by Burroughs users, so we've consequently made plans to do it with other vendors in the future."

Expected to come to fruition "within the year," the expansion will involve "two or three" other vendors who cannot yet be identified, Clark said. BWI charges annual dues of \$92 and is headquartered at Suite 301, 7600 Chevy Chase II, Austin, Texas 78752.

Underground Terminals Help Hike Coal Production by 20%

CHICAGO — Inland Steel Coal Co.'s Mine No. 1 in Sesser, Ill., is producing 20% more coal, and systems supported by underground terminals are part of the reason for the increase, according to Alan Stiefel, manager of raw materials systems.

Stiefel described the installation, which is believed to be the first commercial application of a computer to underground mining in the U.S., to the American Mining Congress here this month.

The computer system is one component of a communication and information system that was developed to improve productivity as a result of recommendations from a 12-person Operations Task Force. "No one [of the 30 implemented task force recommendations] can be pointed to as a panacea, but the trend of declining production has been reversed with a 20% increase in production since 1977," he said.

Four Systems

Four systems were recommended by the task force in response to the particular management needs in an underground mine environment: Production Status and Recording, General Underground, Spare Parts and Maintenance, and Safety. Stiefel stressed the importance of an operational rather than an accounting orientation where he noted "we were looking to make more bucks and would worry about counting the bucks in the future."

The coal company, a wholly owned subsidiary of Inland Steel Co., responded to this orientation by assigning to the development team a full-time foreman picked for his op-

erating experience rather than his educational background.

Other members included two business analysts and a programming project leader from the corporate staff, who moved into housing near the mine location, and three programmers at the data center in E. Chicago, Ind.

Three alternatives were considered when determining what hardware would be used to support the new systems. The first was a stand-alone small computer installed in Sesser; second was a terminal with high-speed printing capability and on-line CRTs connected by phone lines to the corporate computer; (Continued on Page 92)

Nixdorf Enhances 8870/1 CPU, Boosts Memory and Throughput

BURLINGTON, Mass. — In line with its commitment to distributed data processing systems (see story on Page 107), Nixdorf Computer Corp. here introduced a computer system which is essentially an upgrade to the company's 8870/1 workstation-oriented CPU. The enhancements include increased main storage and disk capacity, increased system throughput and several peripheral devices.

Designated the 8870/3, the system includes 512K bytes of main memory, up to 264M bytes of disk storage capacity, a 26-, 39- or 52M-byte cartridge module disk and an eight-color graphics plotter. CPU execution time is reportedly 700 nsec, resulting in

throughput speeds "twice that of the 8870/1," a company spokesman claimed.

The 8870/3 can handle a maximum of 32 workstation peripherals and features simultaneous time-sharing access and bisynchronous communications with other computer systems. It is software-compatible with the 8870/1 and supports Nixdorf's Niro operating system and the Tamos operator control system.

Purchase price for the 8870/3 ranges from \$22,800 to approximately \$300,000, depending upon configuration. Further information is available from Nixdorf Computer Corp. at 168 Middlesex Tnpk., Burlington, Mass. 01803.

SYSTEMS & PERIPHERALS

While Delays Discourage Others

Three Firms Praise 4331 Delivery, Performance

PORTLAND, Ore. — While IBM lost a potential 4331 customer in Chicago because of delays in delivery of its processor [CW, May 12], three companies in this area were unanimous in expressing satisfaction with both the delivery schedule and the performance of 4331 mainframes installed within the last year.

PHA Life Insurance Co. here installed the 4331 to help it maintain "a net growth of 25% annually," according to Skip McNeil, DP manager.

The individual and employee benefits insurance company had already upgraded from a System/3 to a 370 Model 115 in order to keep pace with its growth in premiums from \$1.3 mil-

lion to \$20 million in an 11-year span.

The next step would have been to go with a 370 Model 135 "or maybe a 138," he continued, "[but] we decided to skip a larger 370 and go for the 4300 because, for a little less money, it was possible to obtain the increased performance vital to maintain our growth rate."

'Solid' Performance

Conversion from the 115 began in August 1979 and "I've never seen a computer as solid [as the 4331]," McNeil said. "We've never been down since the conversion was completed in October."

The company's hardware configura-

tion includes 3310 and 3340 disk drives, two 3277 and six 3278 CRTS. Applications running in the environment include general ledger processing, policy administration for group life, health and retirement policies, benefit payments and commission payments for independent agents.

Future plans involve replacing the 3340s and 3370s sometime before October 1980 and building an on-line group policy administration system this year.

The Building Materials Group of Willamette Industries, Inc. received its 4331 "faster than I thought we could, [and] while the 4331 costs slightly more than the previous computer [a

370/158], it yields three times the performance," George Johnston, manager of accounting and DP for the Building Materials Group, maintained.

The mainframe is part of an information gathering network that also includes IBM 8100s at seven locations in Oregon and Louisiana with peripheral storage on six 3310 and six 3340 disk drives. The company plans to install Model 3680 terminals at its retail lumber yards "sometime this summer."

The 4331 ordered by Cowlitz County Public Utility District in Longview, Wash., arrived on a Friday to replace a 360 Model 30. "By Sunday, the 4331 was up and running with no hitch whatsoever," Ted McFadden, DP manager, recalled.

The payroll system on the Model 30 had been running in emulation of a 1440 Autocoder program, McFadden noted, so there are two separate programming generations running on the 4331.

Terminals Boost Coal Production

(Continued from Page 91)

puter center in E. Chicago; third would be some mixture of the first two.

The technical staff recommended utilizing the corporate computers — two IBM 370/168s and a 3032 — for the following reasons: The large data center would have more capacity to handle historical data for analytical studies, and the applications could be brought up in less time by avoiding the installation of new software and equipment.

The current hardware configuration at the mine includes 14 CRTs from Harris Corp., the majority with attached printers, five of which are located underground. The terminals are linked so that shift foremen can direct 40-person mining crews working "faces" as far apart as 8 miles.

Applications Implemented

The Production Status and Reporting application was implemented in September 1978 and is used to provide information on the status of all working sections, quantity of coal mined and reasons for any delays in production to three communications coordinators in a building on the surface.

The General Underground system is used to control the supporting work essential to keeping working places operational. In addition to keeping track of jobs involving general labor, drainage and belt work, the mine superintendent has been able to significantly reduce the time required for month-end reporting.

The Spare Parts and Maintenance system includes inventory control, equipment breakdown (bill of materials) and purchasing. The equipment breakdown facility has been "extremely critical" in reducing downtimes on equipment.

The only item in the original project list which was not completed in the specified 15-mo timetable was the Safety system. This application, which will provide information on standard conditions, violations and corrections, is currently being installed.

Announcing an Intel Seminar on Microcomputer Solutions for the '80s.

The 1980s will require total microcomputer system solutions to enable you — the system designer — to keep pace with ever increasing application complexities. To help you plan for the '80s, Intel is sponsoring a series of one-day seminars discussing the directions for future VLSI computer solutions.

In these seminars, you'll learn how our VLSI solutions uniquely address the needs of the future. Topics discussed will include system-level integration in 16-bit, 16/32-bit, and 32-bit microcomputers; peripherals; software; single board computers — and more. In short, you'll find all the information you need to get a head start on your next generation of products.

Who should attend.

The seminar is intended specifically for software, hardware, and system engineers and managers who will be responsible for designing systems for the '80s. The seminar is structured to give you a comprehensive look into future directions in VLSI computer system development, such as:

- New microprocessor families designed to meet increasing application complexity.
- Tools to speed your product to market by increasing programmer productivity.

- Highest performance micro-system configurations achieved through co-processing and multi-processing.
- Integration of system programming and software functions into silicon.
- Integration of memory management and protection facilities.

Course materials will include a seminar notebook, and an Advanced Data Catalog which will outline Intel's comprehensive line of new products.

Agenda

- 8:00 a.m. Registration
 - 8:30 a.m. Introduction of Intel's total solution approach
 - 10:30 a.m. New Microprocessor Products Preview of three microprocessors covering 16-bit, 16/32-bit, to 32-bit complexity
 - 12:00 Noon — Lunch
 - 1:00 p.m. Microsystem architecture Discussion of new peripheral building blocks and system interconnects
 - 2:30 p.m. Microsystem software Review of new operating systems, high level languages and development tools
 - 3:45 p.m. Summary and questions/answers
- Cost: There is a \$15.00 registration fee which will cover seminar material and lunch.

More information.

For registration information and to guarantee reserved space at the seminar, please contact your local Intel sales office a minimum of one week prior to the seminar in your area. The person to contact for your seminar is listed below, so call today.

Disk System for VAX Users Stores up to 600M Bytes

EATONTOWN, N.J. — The DD 80 disk storage system introduced by Diva, Inc. here provides Digital Equipment Corp. VAX-11/780 users with 80M to 600M bytes of storage, depending on which drive is selected.

The system can be expanded to 5.2G bytes by adding a total of eight disk drives and provides overlap/seek and data transfer speeds "up to 1,209K

bytes/sec," according to the company.

Hardware includes a Computroller V microprocessor-based controller, a synchronous bus interface and the user-specified drives. The standard system features software transparency to the DEC VMS operating system, self-checking diagnostics and accommodation of mixed-capacity drives.

Dual-port drives and off-line pack formatting are available as options.

A basic controller with one 600M-byte drive costs in the neighborhood of \$37,000 to \$38,000. The DD 80 will be shown for the first time at the National Computer Conference by Diva, 607 Industrial Way., Eatontown, N.J. 07724.

Shugart Fixed Disk Drive Doubles Capacity of SA4008

SUNNYVALE, Calif. — A 58M-byte, 14-in. Winchester fixed-disk drive that reportedly offers the lowest cost per 1M byte in its capacity range is available from Shugart Associates, Inc. here.

The SA4100 unit is an addition to Shugart's SA4000 fixed-disk drive series, which includes the 14.5M-byte SA4004 and 29M-byte SA4008. The same interface approach was used on the SA4100 as on the other models in the series, enabling design engineers to "more easily upgrade" existing systems, according to the company.

Performance specifications include a transfer rate of 7.1M bit/sec, aver-

age access time of 65msec and average latency of 10.1 msec. Recording density is 5,534 bit/in. with a track density of 172 tracks/in. The 40-lb unit is mounted in a 19-in. Retma rack and uses about 5.25 in. of panel space. Overall power requirements are reduced Shugart maintained, because of an actuator system that includes an open-loop stepper motor matched with circuitry to step with 24V.

Availability of the SA4100 is expected in the fourth quarter of 1980 with a cost under \$3,000 in 500-unit OEM quantities from Shugart Associates, 435 Oakmead Parkway, Sunnyvale, Calif. 94086.

Bits & Pieces MDS Rental Prices Up 5% on Series 21

PARSIPPANY, N.J. — Effective May 1, Mohawk Data Sciences Corp. (MDS) here increased rental prices by 5% for its System 21/20 and 8% for the System 21/40 distributed data processing (DDP) systems.

Increases of from 5% to 8% were implemented for selected series 21 peripherals and features, and maintenance and installation prices for all series 21 products were increased by an average of 10%.

MDS is at 1599 Littleton Road, Parsippany, N.J. 07054.

Air Conditioner Saves Computer Room Space

NIAGARA FALLS, N.Y. — A computer room air conditioner, specifically designed for installations where space is restricted, has been introduced by Hiross Denco here.

The Spacemaker II, offered in 3- and 5-ton sizes, is 41 in. high by 16 in. deep.

Options include audible and visual alarms and, for northern and central states, an automatic shutoff of the mechanical refrigeration system when outside temperature reaches 35°F.

Price range of the Spacemaker II is \$3,000 to \$5,500, depending on configuration. More information is available from Hiross Denco, P.O. Box 290 L.P.O., 2107 Liberty Drive, Niagara Falls, N.Y. 14304.

Label Printer Meets NRMA's OCR Specifications

DAYTON, Ohio — A label printer that reportedly meets the optical character recognition (OCR) specifications of the National Retailers Merchandising Association (NRMA) has been introduced by Monarch Marking System, Inc., a subsidiary of Pitney Bowes, Inc. here.

The tabletop Model 1644 provides 40-char. capacity at 10 char./line. It accepts labels ranging from 1.1 in. wide by .95 in. to 2.312 in. high.

A warranty policy is included with the purchase and an optional preventive maintenance inspection agreement is available. The 1644 costs \$1,925 from Monarch Marking Systems, P.O. Box 608, Dayton, Ohio 45401.

3M Cleaning Kits Include Diskettes, Cleaning Solution

ST. PAUL, Minn. — Cleaning kits for diskette heads, including two diskettes and a bottle of cleaning solution are available in 8-in. and 5.5-in. sizes for \$30 each from 3M Co., P.O. Box 33600, St. Paul, Minn. 55133.

Wang's 2200 computer works. Over 35,000 different ways.

More than 35,000 times, the Wang 2200 computer has been the choice of small businesses throughout the world. Each time, the 2200 has been called upon to solve a different problem — and each time it has come through.

The Wang 2200 will come through for your business, too. With an integrated system tailored to do exactly what you need done. Payroll.

Making the world more productive.

Second International User Library Service Bureau Using Honeywell CP-6

TORONTO — The second largest library service bureau in North America has become the second international user of Honeywell, Inc.'s Control Program 6 (CP-6) operating system.

The University of Toronto Library Automation System (Utlas), a self-supporting subsidiary of the university, has purchased two Honeywell Level 66/DPS/C large-scale, distributed processing systems on which to run the CP-6.

The system was designed to provide on-line processing

while simultaneously accommodating multiprogrammed local and remote batch processing — capabilities that are important for supporting Utlas' applications.

Utlas has been supplying computer-based systems and services to libraries since 1973 and has grown into one of the largest on-line computer systems for library cataloging in the world.

Batch processing at Utlas includes production of library catalogs and output for card catalogs and computer output

microfilm (COM) catalogs. Utlas reportedly pioneered the use of COM catalogs in libraries. Currently, the firm produces more than 75 catalogs, which range in size from one fiche to the world's largest with more than six million entries.

On-line access to these catalogs enhances and simplifies the search for books, films and other materials in Utlas' own and subscribers' libraries.

Central Data Base

The central data base at Utlas houses more than seven million catalog records, of which almost five million are unique. All records can be shared by Utlas clients across Canada and the U.S.

The group's services are provided in both French and English. Its COM and laser printing services offer a 189-char. set used for output in more than 100 languages. Utlas' reduced cataloging costs are said to make improvement of public services to library patrons more affordable for libraries.

The central data base offers the capability of incorporating changes that are specific and unique to each of the libraries concerned, and its automation increases speed, efficiency and accuracy in the updating and editing of catalog records.

The recent enhancement of the Utlas system to include "authorities control" — use of standard forms of names — increases the utility of the data base by linking such apparently different records as "Mark Twain" and "Samuel Clemens."

The central data base includes not only bibliographic data, but it also directly informs the user which library has it and where that informa-

tion is located.

For instance, at any of the almost 250 terminals scattered from Saint John's, Nfld., to Victoria, B.C., a library can find the exact location of the seven million books, periodicals, films, maps and other material housed in the data base. Exact title or subject names are not required because the user can browse through the data base using Boolean operators and partial text.

Through the on-line system at Utlas, libraries can receive a wide range of library catalog cards, COM catalogs and book catalogs. In addition, data stored in the computer is used to produce various types of specialized listings for the Utlas user.

For example, specialized catalogs of audiovisual materials or lists of materials for the handicapped are available. Currently, a specialized catalog of material in Ojibwe and Cree languages is being created.

Ease of Conversion

The purchase of the Honeywell systems with the CP-6 operating system is a logical extension of the present Xerox Corp. Sigma computer equipment used by Utlas, according to George Gorsline Jr., manager of network planning and operations and chairman of the exchange user group.

"CP-6 is a giant step beyond CP-V," Gorsline noted, claiming that its features include "mature commercial processing and the best time-sharing in the marketplace."

"We're excited about CP-6 because it is a reimplementation of CP-V on an established hardware base by the same people at Honeywell's Los Angeles Development Center with whom we have been

working for many years," he added.

This continuity of support staff and of operating system personality — responsiveness, common file format and easy-to-use Job Control Language and utilities — makes conversion much less formidable," he maintained.

Future Growth

"The data base currently has more than seven million records and is growing at a rate in excess of two million per annum. Yet we can still do a full search for an item in one to three seconds under peak loads," Gorsline said. "With CP-6, we expect to grow to 500 or more concurrent users and expand the data base to 50 million records with similar or better response."

Gorsline indicated that the two-part conversion would be a big job, moving from Meta-symbol (machine) language applications on a locally written file management system to a Cobol/IDS-II environment.

"We think the effort to convert to CP-6 is going to be much less than to go to any other non-CP-V system," Gorsline said. "As distributed processing becomes more of a reality, this transportability into network nodes or intelligent terminals will become an increasingly attractive option."

The installation of the CP-6 system, a DPS/C5, was completed in October 1979. The installation of the second system, a DPS/C3, should be completed by the same time this year.

Prior to delivery of the CP-6 system, Utlas installed Honeywell-built peripherals on its Sigma systems, including 40 units of 200M-byte disks, MOS memories and Level 6 front-end processors

Leases available now.

SAVE

BIG
BEFORE JULY 1ST

Effective July 1st, 1980, MCBA will increase the license fees for virtually all its software products.

The increased fees will affect MCBA's application packages for DEC® Data General, Wang, Texas Instruments, and Plessey mini-computers.

Our sales department expects heavy traffic prior to the July 1st deadline, so if you have been intending to buy any of MCBA's award-winning business applications, don't wait until the last minute. Orders received after the price increases cannot be accepted at the old prices.

MCBA Mini-Computer Business Applications, Inc.
117 South Brand Boulevard
Glendale, California 91204
Telephone (213) 247-9050 Telex 194168

Data Entry Meet Slated

STAMFORD, Conn. — A miniconference designed to help data entry professionals improve management skills, reduce costs and keep pace with expanded technology is being offered by the Data Entry Management Association (Dema) at the Sheraton Centre in New York on June 3-4.

Two seminars which will address methods to improve data entry productivity and distributed data entry in the automated office will also be scheduled on June 3-4.

Total registration fee is \$400 for Dema members and \$420 for nonmembers. Further information is available from Dema, P.O. Box 3231, Stamford, Conn. 06905.

TEKTRONIX USERS: If you had called Romelan last week about our like-new 4012 displays, you'd be looking at one right now instead of this ad.

These used 4012 displays are in mint condition, and they're in stock.

Our Tektronix 4631/4632 hardcopy units are still in the original cartons.

If you buy 4012 displays from the manufacturer, you would pay \$1000 more, and you could wait twelve weeks or more for delivery.

Quantities are limited and subject to prior sale, so don't

wait.

To save \$1000 of your money and twelve weeks of your time, pick up the phone now.

Call Romelan person to person collect. Ask to speak to Gordon Norris, Richard Hauck or Bob Roe about Tektronix equipment.

Your call will be put right through.

Don't write. Call. This offer is too good to last.

DP Dialogue

Notes and observations from IBM
that may prove of interest to
data processing professionals

Ingredients are mixed for a perfume fragrance at International Flavors & Fragrances. To protect valuable formulas during transmission, IFF uses IBM 3845 and 3846 Data Encryption Devices.

With Data Encryption, Scents are Safe at IFF

Some of the world's most fragrant data traffic flows between New York City and Hazlet, New Jersey. As International Flavors & Fragrances Inc. (IFF) transmits valuable formulas for synthetic scents between its Hazlet headquarters and its New York office through the public telephone system, an IBM data encryption device protects them from unauthorized access.

Referring to the IBM 3845/6 Data Encryption Devices, Lewis G. Augustine, director of systems and data processing, says: "We plugged them in and they worked; that was the entire installation procedure. And data encryption has never been the cause of any operating problem."

Few compounds are more complex than the fragrances used in toiletries, detergents, cosmetics and many other consumer items. The bill of materials for one scent typically includes thousands of line items, and its summarized "explosion" can require 50 pages of printout from the firm's IBM System/370 Model 138 at Hazlet. Augustine points out that fragrances are formulated by combining "subcompounds" — recognized varieties such as lilac and geranium — which are themselves mixtures of subcompounds and primary ingredients. A completed formula may include subcompounds at as many as 33 levels.

"Our creative group in New York develops a thousand new fragrances a month to submit to our customers," Augustine continues, "so there is a continuous heavy flow of formulas between the New York office and our technical people here. This traffic is multiplied because a single fragrance often must be formulated many times: a scent for, say, a line of related toiletries works differently in the cologne, soap, deodorant, and so forth."

"The ability of our creative group to develop a fragrance that meets a customer's need — and to synthesize that fragrance suitably for his product — is our major business asset. The security of that data traffic is vital to us. With the IBM data encryption devices, we have the absolute security of communication we need."

The 3845 and 3846 use the U.S. National Bureau of Standards Data Encryption Standard, a process for encrypting data under control of a key-variable supplied by the user.

"Without these devices, our alternatives would not have been attractive: to develop our own software encryption method and install a decrypting computer in New York. Or to hire couriers to hand-carry formulas. Obviously, the IBM devices have been far more simple, economical, and effective."

Dictionary Insures Data Integrity at Cities Service

"We concentrate on making data meaningful," Larry Myerley of Cities Service Company says. "Vital strategic data must be current, accurate and secure. The dictionary plays a vital role in achieving that."

Myerley, manager, data base development, is discussing the role of the IBM DB/DC Data Dictionary. Cities Service, he explains, has made data management for its corporate information system a separate professional function, to define and standardize data elements used in common by many applications.

Myerley's staff has identified 28 attributes of a data element, he continues, such as the coding structure, the input source, persons authorized to access or change it, and other data with which it is interdependent. The dictionary stores these attributes of each element, the identity of all programs that use or affect it, and a record of the frequency with which it is used. Naming standards created at Cities Service are used to assign both computer-oriented and business (i.e., end-user oriented) designations, with the dictionary providing the cross-references between them.

The Cities Service corporate computer center in Tulsa, which includes an IBM System/370 Models 168AP and 158AP, uses the Information Management System/Virtual Storage (IMS/VS). "When we began putting data in IMS instead of imbedding it in individual programs," Myerley notes, "we immediately

found that we needed a tool to keep track of it, even on a small-scale pilot project. We couldn't keep the information in our heads."

It is important, he points out, to respond to changing needs. As an example, he cites the introduction of a new employee stock ownership plan that required 11 or 12 new programs.

"With the aid of the dictionary," he adds, "we had no difficulty adding the

required elements to the IMS data base without impacting existing programs."

"Or consider a set of 12 master files for financial processing. They support about 300 programs serving different interests, but the dictionary enables us to identify every application program using any data element, and to measure and plan the work of preparing these applications to migrate to IMS."

"Eventually, the data system, though

independent, will be available to the information systems, and will be dedicated to producing valid, current data. It will be stable, changing slowly. But the information systems — processing data to produce useful information — will be dynamic, changing as needs change. The stability of the data environment, which will be achieved with the help of the data dictionary, will let us respond fast to these demands."

Interior of a Cities Service production platform in the Gulf of Mexico. Cities Service uses the IBM DB/DC Data Dictionary to help assure the integrity and validity of data in its corporate information system.

A computer system is only as good as its terminals

Without easy-to-use, flexible terminals, even the smartest computer can act pretty dumb.

At Hewlett-Packard, we've designed display stations, printers, and plotters that can make almost any system better, no matter what the application. Need clear, easy-to-read alphanumerics? Graphics without graphics software? We've got them. Data capture devices or high-speed printouts? Just choose the terminal that's right for you.

Intelligent Graphics Terminal

Our top-of-the-line HP 2647A has a Multi-Plot feature that lets you plot your tabular data in a variety of formats without writing any software. Or, for more sophisticated applications, you can program the terminal using simple, English-like commands in AGL, our graphics extension of BASIC.

Interactive Graphics Terminal

The high-performance HP 2648A lets you plot tabular data without writing any host CPU software. It combines full alphanumerics and graphics capabilities, including autoplot, raster scan, area shading and rubber band line.

Interactive Display Station

The HP 2645A is the smartest of our alphanumeric terminals. Micro-processor control provides easy editing, scrolling and forms-building capability, and special user-definable "softkeys" streamline repetitive jobs. Optional dual cartridge tapes provide up to 110K bytes of storage each.

Interactive Terminal/Printer

The easy-to-use HP 2621 interactive terminals have typewriter-like keyboards with control keys labeled right on the screen for self-test, configuration, display and editing. And with just a key-stroke, the 2621P's built-in thermal printer will deliver a printout from the screen in seconds.

Impact Printers

Hard copy is easy with our microprocessor-controlled HP 2635 Printing Terminal and 2631 Printer. The easy-to-read 7 x 9 dot matrix meets the 128-character ASCII Standard, allows true underlining and descenders, and prints six-part forms. The 2631G model even prints graphics output from HP 2647/48 terminals.

Both the 2635 and 2631 zip along at 180 cps in both directions. The micro-processor determines the optimum print path, and a high-speed slew speeds up printing columnar data.

Good as the terminals it supports.

Most HP terminals are compatible with major interface standards and work with computers from a wide range of manufacturers. And they come with full HP support, service, and documentation.

Want to get the complete story on just how good our terminals are? Call your nearest HP office listed in the White Pages and ask for details. Or mail us the coupon below and we'll be glad to send you more information.

Data Capture Devices

Designed for easy operation by plant personnel, the table-top HP 3075A and wall-mounted HP 3076A terminals can be configured for applications like job or product status tracking, labor data reporting, and work-in-progress monitoring.

The HP 3077A time reporting terminal has a built-in clock/display and punched badge reader for time and attendance applications.

Graphics Plotter

The HP 7225A offers a cost-effective approach to professional hard copy graphics. By changing a plug-in module, the 7225A will provide the appropriate interface, language, and graphics capabilities for a variety of computer and instrument systems.

Thermal Plotter/Printer

The desktop HP 7245A uses a thin-film head to produce quality graphics, clean printing and flexible labeling. There are two printing speeds (19 and 38 cps) in four orthogonal directions, and drawn characters may be programmed for size, slant, direction and placement.

Multicolor Graphics Plotter

The microprocessor-based HP 9872A plotter produces high-quality, multicolored graphic plots on charts up to 280x432 mm. It has five built-in character sets, with labeling, point digitizing, character sizing and window plotting capabilities.

ICL Canada Brings Out Family of IBM Rivals

TORONTO — A range of medium-powered computer systems that will face IBM's System/34, System/38 and the 4331 at the top end has been introduced by ICL Computers Canada, Ltd.

The ME29 Model 35 and Model 45 "will be 1% to 15% less expensive" than corresponding IBM systems, according to Thomas J. Woodhill, president, and will offer up to five times the DP throughput of ICL's 2903/4 mainframe.

Both the Model 35 and 45 utilize a microprogrammed processor operating at speeds in excess of 3 million instruction/sec with data transfer

rates of 4M byte/sec, the company claimed.

The Model 35 is available with main storage ranging from 256K to a maximum of 1M bytes; the Model 45's main memory range is from 384K to 1M bytes. Either 64K bytes or 128K bytes of control memory with a 155 nsec cycle speed is available for systems microcode. Bytes of control memory, a 1M-byte flexible disk drive, 35M bytes of fixed disk storage, a workstation and a printer is about \$75,000.

ICL Computers Canada, Ltd. is at 1 Tippett Road, Downsview, Toronto, Ont. M3H 5T2, Canada.

Standard Oil Adds 470s To T/S Network of 370s

SAN FRANCISCO — Standard Oil of California here has added three Amdahl Corp. mainframes to its time-sharing network in order to meet a demand which has been growing at a rate of "more than 50% a year compounded."

The company began running out of time-sharing capacity on its IBM 370/168 and 370/158 in early 1978. "We chose the Amdahl 470V/6 primarily on the basis of delivery and price/performance considerations," William T. Houghton, manager of the Computer Operations and Systems Division, maintained. "In addition, National CSS, Inc., whose time-sharing software we had been using since

1970, had a 470V/6 already installed and running smoothly, so we felt there would be little risk to us in moving to an Amdahl computer."

The first 470V/6, with 6M bytes of main memory, was installed in April 1978; the second was installed the following August. A year later, in August 1979, Standard Oil added an 8M-byte 470V/7, then field-upgraded that machine to a V/8 this April.

The time-sharing computers run under National CSS VP/CSS operating system 24 hours a day, every day of the week. They are configured with eight strings of IBM 3350s with eight drives per string and a storage capacity of 317M bytes per drive.

Other peripherals include 11 IBM 2305 drums, 16 tape drives and 4 Comten, Inc. 3670 front-end processors.

Heavy Usage

At peak demand, about 350 people are accessing the system through dial-up lines at speeds of 300- or 1,200 bit/sec or at 9,600 bit/sec over leased lines with remote communication handled by Tymshare, Inc.'s Tymnet. Approximately 60% of this usage comes from the Computer Services Department for program development and maintenance.

Other heavy users include Standard Oil's refineries and Chevron Research. Most of the refinery applications are operationally oriented and range from analyzing individual process unit data and recommending operational improvements to scheduling and long-range planning tools for the total refinery.

Chevron Research uses the system to support all its refinery design activities.

It is projected that the system should be able to handle "more than 500" simultaneous users when the computers are configured to their maximum, Houghton said.

Centronics Hikes Printer Prices

HUDSON, N.H. — Centronics Data Computer Corp. has announced price changes which affect most of its printers as well as rates for spare parts and service.

With the exception of Centronics' 730 and 737 small business printers, prices for the 100, 300, 500 and 700 series matrix printers and the 6000 series bank line printers were increased 6%.

The sole reduction in pricing was for the nonimpact Microprinter P-1, whose price was reduced "up to 30%." Printers ordered before May 31 will not be affected by the price changes if delivery is required by Aug. 29. Orders calling for delivery after Aug. 29 or received after May 30 will be at the newly announced prices.

Spare parts prices have been raised eight percent on current models and ten percent on the older 100, 300 and 500 series effective June 1. While the charge for service when the customer brings the printer to a service center remains unchanged, most other service rates were increased 10% effective April 1.

TELEX DELIVERS YOUR FIRST ALTERNATIVES TO THE LATEST 3274/3276 TERMINAL SUBSYSTEMS.

**For less cost.
In less time.**

Now you can have the latest terminal technology without waiting up to a year, or more, to get it. Because the new Telex 276 display controller along with the 278 keyboard display and 286B printer, incorporate the same technology as the IBM 3276, 3278, and 3287 terminals. And you can get them in 90 days or less.

They're fully plug-compatible with the IBM systems and offer extras, too. Better non-glare screens, for example, along with greater keyboard flexibility (including expanded 10-key numeric pads and reverse program function keys). And the 286B daisywheel printer offers letter quality resolution as a 3287 replacement. The newly introduced 287B is our 3287 matrix printer version.

Another big advantage is they're smaller. Our new display terminals weigh up to 30 lbs. less and require less table top depth than theirs. For the office, our new 278 executive model fits neatly on credenzas, as well as on sales desks, teller stations, hospital nurse stations, etc. And it's available in a 9-inch screen.

To date, we've shipped more than 50,000 3270 replacement terminals, because our cost-effective terminals do the job. In many cases, you can save up to 40%, depending on whether you buy or lease.

So, if you want the most advanced terminals on the market, and you want them now, phone your nearest Telex representative. Or call our Marketing Department in Tulsa at (918) 627-1111.

The latest technology doesn't have to arrive late.

The innovation continues... TELEX

In Southeastern Massachusetts COM-Based Cancer Registry Serving Hospitals

By Stephen L. Priest
And Vincent J. O'Sullivan
Special to CW

BROCKTON, Mass. — In Computerworld's Special Report, "Stretching the DP Dollar" [CW, Sept. 24], an article by Stephen L. Priest and Robert L. Sheehan described the cost savings realized by Brockton Hospital in converting general accounting and business office reports from hard copy to microfiche. The hospital was also beginning to use microfiche for its cancer registry reports. The following is an update on the various reports now offered by the registry.

The Brockton Hospital Southeastern Massachusetts Cancer Registry (Semcare) provides an annual follow-up of every cancer patient as well as incidence and survival statistics to the medical staffs and administrations of almost all the major hospitals in southeastern Massachusetts.

And, since Massachusetts is apparently about to enact legislation that would make the reporting of the incidence of cancer mandatory, we are in the process of offering the registry's reporting service to all hospitals within the state.

Beginning with four hospitals in the immediate Brockton area, the system has expanded to include 14 hospitals in the southeast region of Massachusetts. With these additions, the registry is able to provide areawide, detailed analyses for southeastern Massachusetts.

In line with this expansion, a Professional Advisory Committee has been established to oversee the medical appropriateness of the registry system. The committee is comprised of a representative physician from each participating hospital, as well as an appointed registry physician consultant, information systems specialist and the regional registry coordinator.

The committee meets on a quarterly basis to review the input and output of the registry and seeks to maintain and improve the system. The use of this committee makes each hospital a working partner in the registry with opportunities and responsibilities to provide user feedback.

Brockton Hospital recently received its third consecutive accreditation from the American College of Surgeons (Acos), awarded in recognition of its successful cancer management program. Within the system, other hospitals have also been able to obtain individual accreditation when they became eligible — none has been refused once it has requested and completed the ACOS survey review.

Media Differences

Source document microfiche and computer output microfiche (COM) are often equated, but there are several important differences between the two media.

The source document microfiche process involves taking pictures of actual paper records and developing the film, in much the same way that photographs are taken with a conventional camera.

This process can affect the quality of the resulting record as well as the amount of time needed to actually obtain it. For example, if the original doc-

ument is illegible or damaged, the microfiche will reflect that fact no matter how technically precise the process is. On the other hand, faulty focusing or missed exposure will result in bad film no matter how good the original copy is.

The source document microfiche process is time-consuming, necessitates physical removal of valuable material and can result in increased reference time and frustration if a needed record is "out to be microfilmed."

COM is technically an entirely different concept, and the results are more satisfactory.

The Brockton Hospital Semcare system uses an NCR Corp. C-200 system

for its computer services. Nine-channel, 800 bit/in. magnetic tapes containing the reports intended for microfiche are picked up by a microfiche service bureau, Microdata Service Center, Inc., in Boston. Microfiche are returned to the hospital within 24 hours.

The record is "untouched by human hands," and the resulting text is clear and clean. Each 4.25 in. by 5.75 in. fiche can contain the equivalent of as many as 207 pages of 11 in. by 14 in. computer output.

Follow-up of patients provides the data base that generates survival statistics and, most importantly, helps to ensure that cancer patients are seen

regularly by physicians.

The COM system has many advantages over the use of paper, especially in a cancer registry system that is batch-oriented rather than on-line and is spread over a fairly large geographic area. Microfiche enhances report utilization while increasing storage capacity, minimizing hospital costs.

The growing recognition of these advantages is illustrated by the fact that we have already provided software and documentation to five U.S. hospitals so that they can implement the identical system.

Priest is director of information systems at Brockton Hospital. O'Sullivan is regional registry coordinator.

If you don't like the
mess of carbon forms,
but you like their
economy . . .

Ask about OPAS®!

Ask your business forms supplier about OPAS.

It's the Mead system which enables manufacturers to supply the benefits of multi-part carbonless paper business forms at the cost of carbon forms. Avoid the mess and bother of carbon interleaves, enjoy the cleanliness, efficiency and sharp image of carbonless. Ask about forms made with OPAS and, if you're interested, you can try a free sample. Just write to Mead at the address below.

BASF polishes off headcrash.

Forget about media-induced headcrash when you specify BASF Tridents or Storage Modules. BASF polishes its uncoated metal disks to a mirror finish before the magnetic coating goes on. This assures the smoothest surface for optimum headflight characteristics. In addition, BASF coats each disk with the most durable magnetic coating, then polishes and burnishes it by a

unique process, assuring long-lasting trouble-free operation. All oxide particles in the coating are magnetically oriented for greater packing density. For peak performance, each pack is 100% drive-tested at the factory. For the name of your nearest supplier, write BASF Systems, Crosby Drive, Bedford, MA 01730, or call 617-271-4030.

All BASF Trident and Storage Module packs are available for immediate delivery.

Each BASF disk pack is supplied in a precision-molded solid Lexan® plastic cover set, so you can be sure of absolute cleanliness when the pack is stored off-line.

80 MB capacity Trident packs are available in three configurations: 1. 100% error-free—for the most demanding applications. 2. Flag-free—for systems with error correction but no alternate track reassignment. 3. Standard—for systems with error correction and reassignment capability.

Only BASF has had more than four decades of experience in magnetic media...more than twelve years of disk pack experience in the U.S.A.

80 MB capacity Storage Module packs are available formatted for CDC or Honeywell drives.

BASF can work with you to accommodate special error criteria requirements.

More Than 900 Systems Rated Polled Users Happy With Present Gear

CHERRY HILL, N.J. — The majority of small business computer users are basically satisfied with their present systems and do not foresee any drastic equipment changes in the near future, according to a recent Management Information Corp. (MIC) survey.

In an effort to determine how well small business DP products are meeting user needs, MIC surveyed more than 600 companies across the country. In all, the companies represent nearly 900 installed small business computer systems and 1,446 peripheral devices. As part of the survey, MIC also collected data on 255 software products.

Users were asked to rate their equipment's performance, reliability, ease of use, service and support on a scale of 1 to 4, with 4 being the top rating. In the performance category, users compared their equipment expectations against vendor claims, while in the

Manufacturer and Model	Respondents	Units	Performance	Reliability	Ease of Use	Service	Support
Radio/Telex 400	10	19	3.6	3.5	3.0	3.5	3.5
Data General Nova	9	11	3.4	3.4	3.2	2.9	2.3
Digital Equipment PDP-11	16	17	3.4	3.2	3.2	3.0	2.3
IBM System 32	15	16	3.7	3.4	3.0	3.5	3.4
Micromata Reality	41	84	3.8	3.8	3.9	3.4	3.2
Vary 2200	10	11	3.8	3.7	3.3	3.5	2.8

Six manufacturers of the nearly 900 computer systems listed in Management Information Corp.'s annual small business computer survey are shown. Computers are rated from 1 to 4, with 4 indicating the highest rating.

ease-of-use slot they were asked to consider the amount of time it took to train new personnel on their particular machines.

The results: Better than 70% of the users

polled are happy and intend to stick with their present systems, 9.5% of the respondents are planning a change within a year and 19% of the users expressed interest in revamping their computer systems within three years. Reasons for wanting a change include technology and growth, bad service, an increase in price/performance and the quest for a faster and larger system, the report noted.

Interestingly, 25% more users want to stay with their present computer setups than users questioned last year in a similar MIC survey. In nitty-gritty hardware terms, six

Small Business System Gives Multiple Languages, Protocols

LEXINGTON, Mass. — NEC Information Systems, Inc. has introduced a small business computer that offers multiple programming languages, communications protocols, a text-processing capability and an integrated set of business application software.

The Astra Model 205 includes 128K bytes of main memory that is expandable to 256K bytes, two 1.2M-byte double-sided double-density diskette drives that can be expanded to four, a 120 char./sec printer and a CRT terminal. The system's communication protocols allow it to work as a stand-alone business computer, as a member of an Astra network or to access IBM networks under 3780 and 3740 batch or asynchronous modes.

The 205 utilizes a 16-bit microprocessor with 114 business DP-oriented instructions and supports Cobol, Basic and a macroassembler language.

The applications software programs include a recently developed text-processing program called Astra Write, a sales order processing and analysis package, inventory control, billing control, accounts receivable and payable, general ledger and payroll packages, a spokesman stated.

The Astra Model 205 costs about \$13,310 and will be available in July. For an addi-

tional \$330, a letter-quality Spinwriter printer may be substituted for NEC's matrix printer, the spokesman added from the firm at 5 Militia Drive, Lexington, Mass. 02173.

Disk Subsystem Reconfigured To Be Multibus-Compatible

SAN FRANCISCO — Micromation, Inc. has unveiled a floppy disk subsystem that is compatible with Intel Corp.'s Multibus and runs under Digital Research, Inc.'s CP/M and MP/M and all Intel software, including Isis II.

The MM-SBC-80 is a reconfiguration of the firm's Megabox series and incorporates a disk controller that is said to provide more features than Intel's ISBC-201 single-density and ISBC-202 double-density devices combined. The Micromation controller supports both Intel formats as well as IBM 3740 single-density soft-sectored format and the IBM System/3 double-density mode.

The MM-SBC-80 controls up to four Shugart Associates, Inc. 800/850-type 8-in. floppy drives or equivalents in both single-

and double-density modes. With the device, the user can reportedly read and write from a single-density drive to a double-density diskette on another drive, or vice versa, a spokesman said. The controller automatically determines the density of the inserted diskette, with no console input required.

The two Shugart drives included with the system provide 1M byte of on-line data storage. However, an optional configuration uses two Remex 8-in. double-sided drives and gives 2M bytes of storage.

The system includes the controller, all cables, drives and power supplies and a rack-mount cabinet. The cost is \$3,195, but the controller can be purchased separately for \$995 from Micromation at 1620 Montgomery St., San Francisco, Calif. 94111.

Like the Lear Siegler ADM-31, a highly intelligent buffered terminal that practically thinks for itself. And the smarter ADM-42 with its 15-inch diagonal screen. Or the low-cost DUMB* terminal from LSI, the ADM-3A which at \$850 makes a lot more sense than its name implies.

Plus the new LSI ADM-3+, with standard numeric pad and full-ascii character set. And the new Retro-Graphics™ package for the ADM-3A+.

*TM Lear Siegler Inc. ITM Digital Engineering, Inc.

You save time and trouble with our free on-site 90-day warranty which covers the terminal and every other systems component we sell. For information on economical lease or purchase plans or details on DASI's complete line of computer-room supplies, call your district office or the toll-free number below.

With Step-by-Step Software

Turnkey a 'Snap' for Business Users

NEWINGTON, N.H. — A multimicroprocessor-based small business computer containing software designed to lead the user through a variety of business applications has been introduced by EZdata, Inc.

The Simple and Natural Applications Programming (Snap) computer is a turnkey system with 48K bytes of resident memory, 2.4M bytes of dual-floppy double-density disk storage, a standard CRT terminal and a 50 char./sec printer. The system has a keyboard with 26 function keys and a numeric keyboard. In addition, the Snap computer can handle up to four CRT terminals, up to eight floppy and hard disk drives and a variety of high-performance printers, a spokesman

claimed.

The crux of the system is the software, which is designed to lead the user through applications by offering a number of explanations, alternatives

The EZdata Snap

and assistance routines. For instance, a Help command is available that is said to fully explain each application step. Moreover, the software was designed to remind the user about display formats and to check back with the user if there are any questions concerning text misspellings.

Software features include a conversational compiler, four transaction processing modes, an audit trail, fully assisted entry routines, data file sorts and variable-length data fields.

The Snap system costs \$15,000, including the software license. Additional information on the small business system can be obtained from EZdata at Newington Industrial Park, Newington, N.H. 03801.

VAX-11/780s,
PDP-11s Get
Color Graphics

MAYNARD, Mass. — Digital Equipment Corp. here introduced a family of graphics subsystems compatible with its PDP-11 computers and the VAX-11/780 minicomputer.

Supported by the RSX-11M, RSX-11S and VAX/VMS operating systems, the VSV11 and VS11 models are available with either a 19-in. VRV02 full-color display terminal or a monochrome VT100 terminal.

In addition to the terminal, the subsystem is composed of an image processor, a sync generator and image memory. It interfaces directly with the LS1-bus microcomputer and utilizes a bus converter for the PDP-11 Unibus interface. The image processor, based on 2901 bit-slice technology, supposedly allows data to be displayed "significantly faster" than the rate achieved by serial line graphics terminals.

The image memory is a video frame buffer with 512 by 512 by 2 bits of resolution and intensity in the basic configuration. It is switch-selectable for noninterlaced operation at 512 by 256 by 4 bits.

An additional image memory can be added to the subsystem to double the capacity for 16-color graphics.

The price of the VSV11 monochrome version begins at \$7,900, and the color terminal option brings that starting price to \$13,600. The monochrome VS11 starts at \$8,600, with the color version priced from \$14,200.

Deliveries are scheduled to begin in October from DEC in Maynard, Mass. 01754.

Cromemco Adds
Graphics Link

MOUNTAIN VIEW, Calif. — Cromemco, Inc. has unveiled a graphics interface for its computer systems which can be used to display color or black-and-white images.

The SDI consists of two circuit boards that plug directly into the S-100 bus of the firm's microcomputer systems. The device uses direct memory access to display the contents of memory and features high-point resolution, color map selection, a dual-page windowing function, an automatic area fill mode and a Northern Telecom Systems Corp. broadcast compatibility, a spokesman said.

The SDI displays images with up to 756 by 484 point resolution and can produce graphics in two different modes, nybble-mapped or bit-mapped. In the nybble-mapped mode, any 16 of 4,096 possible colors can be displayed in a single picture. In black-and-white, there can be 16 shades of gray, the spokesman claimed. The bit-mapped mode can display any two colors or straight black-on-white displays.

Finally, picture information is accessed by the SDI through the firm's 16K and 48K-byte two-port memory cards in the microcomputer. Use of the two-port memory for the display utilizes the MPU 75% to 100% of the time, depending on the application software, the spokesman said.

The graphics interface costs \$595 from Cromemco at 280 Bernardo Ave., Mountain View, Calif. 94043.

Introducing The PTS-2000.

Your low-cost, expandable window
to today's and tomorrow's
3270-type networks.

The PTS-2000 Series is Raytheon's brand new information display system for the Eighties.

In its initial configuration — available right now at prices up to 25 per cent below competition — the PTS-2000 system emulates the small-cluster 3276-type information display system. It is designed to support both binary synchronous and SNA/SDLC operating protocols, 9600 bps data rates. Screen sizes up to 3440 characters. And all of the advanced features you expect from a modern network terminal system: cursor select, 25th line, and total compatibility within a 3276-type network.

But there is where the similarities end. Because the PTS-2000 is designed to go far beyond alternative products of its class. It has far more intelligence, expandability, compactness, and upgradeability than any other 3270-type terminal system.

Soon it will be expanded to emulate 3274-type large-cluster systems, to support local disk drives for queued input, and to link Raytheon's VT word processors. Later, the family will grow even further — to become powerful SNA-compatible distributed processing, combined word and data processing, and network processing systems.

The PTS-2000 in 3276-mode operation is the start of an information display terminal family that will grow with your network needs far into the future. And with total compatibility and familiarity.

Get your first PTS-2000 system today. Call our PTS-2000 hotline at (800) 225-9975 or write to PTS-2000, Box 84, at our headquarters for more information.

1415 BOSTON-PROVIDENCE TURNPIKE
NORWOOD, MASSACHUSETTS 02062

With Own Mini, Agency's Output Rises 500%

Special to CW
WILMETTE, Ill. — The Wilmette Park District, a local government run recreation and service agency here, had more than 32,000 reasons for abandoning its service bureau-based DP operation and installing its own small business computer.

Since acquiring the Basic/Four Corp. minicomputer system, the Park District has reduced its clerical staff, started

turning out five times as much work on the same budget and has increased the services it supplies to the 32,000 people living in and around this village on the shore of Lake Michigan. In fact, getting the system was probably the most comprehensive, beneficial business decision ever made by the Wilmette Park District," according to Business Manager Ed Szillat.

The Park District currently

has Basic/Four's System 410 with 96K bytes of memory and with a disk capacity of 42M bytes. The system also contains three local and two remote CRT terminals, a 150 line/min printer and a magnetic tape cartridge backup system.

The district started its in-house computer venture more than four years ago when it installed a Basic/Four Model 400 with a whopping 16K

bytes of memory, Szillat said. "We selected Basic/Four equipment because of the computer's operating system," he added. "I had no computer background, and the system doesn't require any. It automatically checks program logic errors."

Park District officials opted for an in-house computer when it was decided that such a system would help control turnaround time, hold down

costs, produce data in any format and, essentially, be more accurate. A dedicated system would also allow the district to use the same staff to operate the computer that previously prepared transmittal documents for the service bureau.

The declining cost of minicomputers and the fact that the Park District's annual budget had ballooned from \$700,000 in 1969 to \$3 million in 1975 also motivated officials to gravitate to an in-house computer.

Customized Software

Soon after the delivery of the Basic/Four Model 400 in early 1976, the district contracted with A.E. Klawitter and Associates of Glenview, Ill., to work with its staff in designing a comprehensive software program specifically suited to meet the local government's accounting and reporting needs. The program was designed, written, installed and operational by February 1977.

The software was transferred to the System 410 when it replaced the 400 in April 1979.

Today, the Park District has blossomed into a \$4.5 million operation with 700 employees. Officials here are responsible for 20 parks, an 18-hole golf course, a number of pro shops, a restaurant, eight indoor tennis courts, two indoor ice skating rinks, two outdoor pools, a community center, two beaches and the functions of about 500 recreation programs.

No More Lines

Business Manager Szillat said the computer system handles all of the district's accounting and financial reporting, perpetually records statistical data on individuals-by-households and provides reports on trends and demographics. The computer is also used as a word processor to prepare brochure copy. It processes, in addition, about 20,000 activity registrations a year for the more than 1,500 class sessions offered by the district.

"With the computer, our registration system eliminated the need for people to wait in lines," Szillat continued. "We picked up a 10% increase in registrations the first year by eliminating lines. People can register by mail or by depositing an entry form in a special box."

The district's participant registration system was put to another use when it was modified for the North Suburban Special Recreation Association in nearby Highland Park. The modification lets that association provide services to the handicapped by listing such information as handicap, medication and physician.

Minicomputer TOTAL

"It's the only DBMS that would run on our PDP's in Philadelphia, our System/34's in Seattle, and our Primes in El Paso."

Portability and compatibility are key factors in your choice of a data base management system (DBMS) for minicomputers. Because the sophisticated applications

you build for the 1980's should not lock you into any one hardware configuration or operating system. Only one DBMS delivers this portability and compatibility. Minicomputer TOTAL. TOTAL is the most portable minicomputer DBMS in the industry. Only TOTAL offers horizontal data base portability across 18 different minicomputers and operating systems, while providing vertical compatibility to Series 80 TOTAL in the mainframe environment. This enables you to lay a solid foundation for distributed data base and gain large scale economies of standardized data base design and application development.

In addition to its unmatched portability and compatibility, Minicomputer TOTAL offers a unique blend of power, efficiency and ease-of-use.

POWER. With TOTAL, you have the flexibility to select either hierarchical, network, or multi-keyed data structures. This means you can build the simplest to the most sophisticated information system. And that's important to your evolving needs.

EFFICIENCY. Even with its superior power and flexibility, Minicomputer TOTAL imposes the lowest overhead of

any full-facility DBMS available today. Its powerful design minimizes I/O, memory requirements, and disk space.

This gives you all the benefits of The Total Approach while minimizing your hardware investment. **EASY TO USE.** And TOTAL is easier to learn and use than any other minicomputer DBMS. Data base design and application programming can be mastered after only two days of technical training. The result: faster implementation and higher productivity. So if this unique blend of data base portability, data structuring power, efficiency and ease-of-use is what you're looking for to build your minicomputer based system, you can't afford to overlook TOTAL.

If you're presently working with or considering... DIGITAL PDP-11 or VAX, HONEYWELL Level 6, IBM System/3 or 34, PRIME 150 through 750, PERKIN-ELMER (Interdata) 7/32, 8/32 or 3200 Series, you can use TOTAL now.

To see first hand if Minicomputer TOTAL is the solution to your specific application design requirements

"NCR's VRX is more transparent than any operating system I have ever seen."

Peter P. Blozis, H.J. Wilson Co., Inc.

PETE BLOZIS:

"I've been in EDP for 19 years and have gone through many conversions. So I anticipated problems in installing our new NCR V-8585M. It turned out to be the smoothest conversion I ever experienced."

LEA EDMUNDS:

"We had good reason to be apprehensive. We were putting in the first V-8585M to be installed anywhere. And, at the same time, we were switching to new operating software, NCR's VRX. We ran parallel for three weeks and never developed a conflict. As it turned out, we could have switched over in a single day."

PETE BLOZIS:

"We resisted conversion as long as we could, and then discovered it was completely painless. The V-8585M hardware ran just as NCR predicted. VRX is more

Peter P. Blozis (right) is Wilson's Vice President, Information Services Division. Lea Edmunds is Technical Services Manager.

transparent than any operating software I have ever seen."

* * *

WILSON'S is a chain of jewelry/ catalog showrooms that is spreading across the Sunbelt. And growing at the impressive rate of 37 percent per year. This growth has caused Wilson's to step through five NCR Century systems up to the V-8585M. Supporting an NCR system is easy. As Pete Blozis says "We can support our NCR V-8585M with fewer systems programmers than we'd need for other systems of comparable size."

Find out what NCR VRX can do for you. Phone your representative at your local NCR office. Or write to EDP Systems, NCR Corporation, Box 606, Dayton, Ohio 45401. Learn how NCR brings a new level of convenience to data processing operations.

NCR
Complete Computer Systems

An NCR computer can make it happen for you, too.

Fleet Management Addressed

DALLAS — Century Computer, Inc. has introduced a microcomputer-based Fleet Management System that was designed to keep track of vehicular downtime, monitor maintenance costs and provide data for equipment evaluation.

The turnkey system operates in a real-time mode and is fully documented for operational procedures, diagnostic routines, program logic and I/O steps.

The system features an 8-bit MPU with an RS-232C interface and a minimum of 32K bytes of memory. A CRT terminal, multipoint multiplexer, tape and disk drives, paper tape reader, card reader and 600 line/min printer can also be attached to the system.

Basically, the system provides for on-line parts and labor posting and closing of repair and expense orders and offers an automated cost extension of reported labor

hours, a spokesman stated. The unit notes the number of parts used to fix a vehicle.

In addition, the system can calculate the average failure rate for specified components, enhancing the preventive maintenance procedure.

The Fleet Management System costs between \$5,000 and \$8,000, depending on the configuration. Century Computer is located at Suite 206, 3500 Midway Rd., Dallas, Texas 75240.

Majority of Polled Users Happy With Present Gear

(Continued from Page 101)

small business computers scored an average of 3.0 or better in each category with five or more responses. Those machines are Microdata Corp.'s Reality, which rated at least a 3.8 in performance, reliability and ease of use; Basic/Four Corp.'s Model 400; IBM's System/3 models 6, 10 and 15; and IBM's System/32. Of these six systems, IBM's

System/3 models 6 and 15 received the highest ratings in service and maintenance, while Basic/Four's 400 grabbed the highest slot for manufacturer support, the survey detailed.

On the other hand, the systems with five or more respondents that received the lowest ratings in service and support are Mini-Computer Systems, Inc.'s Micros, with a rating of 2.6 in service, and Data General Corp.'s Nova minicomputer, with a support score of 2.3. However, the Micros and Nova minicomputers both averaged above 3.0 in the performance, reliability and ease-of-use categories, according to the report.

Peripherals Ratings

On the peripherals front, those products that received a 3.0 or better in all categories with five or more responses include Applied Digital Data Systems, Inc., Basic/Four and Microdata display terminals; Dataproducts Corp., Digital Equipment Corp. and IBM printers; Hewlett-Packard Co. magnetic tape drives; and Wang Laboratories, Inc. disk units.

The leading software suppliers in MIC's study that scored a 3.0 or better in all categories with five or more responses are Minicomputer Systems, Inc., Systems Management, Inc. and software houses that distribute Microdata computer products and have developed their own software, the survey said.

Finally, in addition to asking users to rate their systems, MIC requested that respondents identify any problem areas in the current small business computer systems.

Interfacing with other systems was cited as a problem by 20.4% of the users, followed by manufacturer support and program languages. Equipment cost is considered a problem by only 6.8% of the survey participants and equipment design was pinpointed as a trouble spot by less than 3% of the users.

The full MIC report published in the May issue of *Small Business Computer News*, is available for \$15 from MIC at 140 Barclay Center, Cherry Hill, N.J. 08034.

"When your 303X needs more memory, make the better business decision..."

Al Netten, Vice President, Peripheral Systems Group

...choose Control Data."

If you're a large 370 or a 303X user, you may have a long wait for additional main memory. But Control Data can supply you with the memory you need. Now. Availability is immediate—if your need is critical, we can deliver within 45 days.

Greater capacity is another reason our memory is the better business decision. We can boost any 303X system to 16 megabytes. We've already increased several 168 AP's to 16 megabytes, enabling their users to get more performance and throughput. And, delaying the necessity of a much more expensive mainframe.

Experience and support are important, too. More than 700 S/370 installations use our memory. More than 4800 customer engineers

support a full product line of peripheral products for your IBM system.

In terms of price, too, Control Data is the better business decision.

For even more reasons we're the better business decision, call your local representative. For the number of the rep in your area, call 612/553-4046.

Exxon Has a Lot Up Its Sleeve

By Brad Schultz
CW Staff

As the U.S. slides into a recession and petroleum prices soar, what is Exxon Corp. doing in the computer industry?

Maybe this:

- Going for the lead in supercontrollers — the switching systems emerging as integrators of an organization's DP, word processing and voice functions.
- Designing a minicomputer with no central processor or main memory and rumored to be capable of 60M bit/sec satellite communications.
- Developing an alternative to the CRT.

- Perfecting laser technology that may revolutionize nonimpact printing.
- Turning out microprocessors that already rival those offered by the largest chip-

Analysis

makers and that may form the basis of a major thrust into the desktop computer arena.

And a lot more besides, according to a recent study of why the largest U.S. petroleum supplier controls 15 DP-related manufacturers.

The nation's economic doldrums may spell a good opportunity for the high-flying Exxon to tackle the computer industry's established leaders. While the largest U.S. petroleum supplier sets records in quarterly profit totals, the largest computer supplier, IBM, is reportedly strapped for cash.

IBM needs more money to resolve enormous backlogs in its 4300 processor sales, some market analysts say, and to press ahead with processors not announced yet as well as with various communications and venture capital projects. A few Wall Street houses now expect much smaller 1980

(Continued on Page 110)

Japanese RAMs Superior, Tests Made by HP Show

PALO ALTO, Calif. — "Japanese-made 16K random-access memory (RAM) chips are superior to those made in the U.S."

Those may be fighting words in silicon enclaves, but they are essentially the conclusion to which Hewlett-Packard Co. came after conducting rigorous comparison tests on some 300,000 chips supplied by a total of six Japanese and U.S. manufacturers.

Wary of the quality of Japanese-produced 16K RAMs, HP had avoided Japanese imports until the U.S. supply began dwindling in 1977. At that time HP, the 12th largest purchaser of chips worldwide, qualified its first Japanese supplier after tests on its chips proved highly satisfactory.

However, HP considered the outstanding quality of the Japanese chips a fluke until the 16K RAM crunch hit in 1979. HP then tested two more Japanese chip makers and, much to its surprise, found the same glowing results, according to Richard W. Anderson, manager of HP's Data Systems Division. Anderson reported the company's test experience with Japanese semiconductors earlier this year at a seminar sponsored by the Electronic Industries Association of Japan in Washington, D.C.

Particularly startling were HP's comparisons of incoming failure and field failure rates. Japanese 16K RAMs showed a zero failure rate on incoming inspection; products from U.S. manufacturers had failure rates between .11% and .19% — about 100 bad devices per 50,000.

Moreover, field failure rates for 1,000 hours of operation ranged from .010% to .019% for Japanese chips and .059% to .267% for U.S. suppliers (see chart on Page 108).

Aside from these findings, HP's testing also revealed that Japanese 16K RAMs had:

- Fewer failures in production cycles.
- Lower scrap costs.
- Lower rework costs.

(Continued on Page 108)

U.S. Urged To Aid Semis

PALO ALTO, Calif. — Investment in complex, expensive and rapidly obsolete capital equipment is required if the U.S. semiconductor industry wants to build quality into components and keep technological pace with foreign competitors — especially Japan, according to Richard W. Anderson, manager of Hewlett-Packard Co.'s Data Systems Division.

However, in order for domestic device makers to continue to flourish in the international marketplace, the government must create a healthy investment climate, Anderson argued.

Anderson made his point earlier this year at a seminar sponsored by the Electronics Industry Association of Japan at which he

Comparison of Major Suppliers of 16K RAMs to HP

In Hewlett-Packard Tests, Japan's RAMs Found Better

(Continued from Page 107)

- Fewer production interruptions.
- Lower warranty costs.

Although the Japanese have been accused of dumping integrated circuits on the U.S. marketplace, Anderson noted the Japanese have not been the low price vendors.

Approaches to Manufacturing

Researching Japan's method of high-quality semiconductor production, Anderson said Japan takes two basic approaches to manufacturing. One is to screen out failures through repeated testing and inspection, and the other is to avoid building failures or failure mechanisms into the devices

in the first place.

Japan's production is geared to a zero failure rate, he observed. This is achieved by a team approach involving production management in all organizational levels in the company.

In addition, results rather than procedures are emphasized. "Many U.S. firms follow mil specs blindly, even though those mil specs have little to do with achieving quality," Anderson maintained.

Moreover, the Japanese have been quicker to automate assembly to improve quality whereas the costs of device assembly pushed U.S. makers into assembling devices offshore, especially in developing countries. This has led to a quality control problem, Anderson charged.

Government Aid

However, in making his comments to seminar participants, Anderson acknowledged the Japanese government is heavily funding semiconductor research, a fact often cited by U.S. vendors charging unfair competition from the Japanese.

The U.S. government should take a lesson from Japan and create the investment climate necessary to allow U.S. companies to build quality into their semiconductor products lest U.S. makers lose status in the world marketplace, Anderson warned.

Anderson Urges Government Aid

(Continued from Page 107)

disclosed the results of HP's comparison tests on U.S. and Japanese-made 16K random-access memory (RAM) chips (see story above). The tests revealed Japanese-produced 16K RAMs are of significantly higher quality than comparable U.S. devices.

To finance the capital investment necessary for automation which would improve the devices' quality, U.S. manufacturers would have to earn 15% after taxes, Anderson figured. With the U.S. corporate tax rates, this is impossible, he noted.

Recommended Actions

While he stopped short of suggesting the government finance semiconductor research and development, as the Japanese government does, Anderson recommended several actions the U.S. government could take to spur investment.

One of these steps is shortening depreciation schedules and allowing larger equipment expenditures to be expensed, which would free earnings for capital expenditures. Current depreciation rules were developed from industry models that do not apply to today's short product and equipment life cycles, he said.

If capital investment is to be financed from a company's aftertax earnings, then the government should lower corporate income and capital gains taxes, Anderson contended.

Finally, he suggested the government encourage investment by individuals through a more generous exemption of interest and dividend income, perhaps as high as \$2,000 per person.

Cut DP Center Downtime By 50% In 6 Months, Or Your Money Back.

ALARM® pinpoints problem hardware and system degradation plus media factors that can contribute to system failure. Easy-to-read Reliability Reports make maintenance management automatic, returning the power to you, the user... so you control your vendors' C.E.'s, not the other way around.

Performance improvements have been so impressive at data centers where ALARM is already up and running, Johnson Systems now offers this unprecedented Performance Guarantee:

ALARM—Hardware Reliability Measurement System—will reduce your data center downtime by 50% or more within the first 6 months of operation, or Johnson Systems, Inc., will refund your purchase or lease price in full.

One DP operation boasts ALARM pays for itself each and every month. But only you know what it costs when your DP system slows or crashes. So figure it up in downtime man-hour savings and full production potential with your present operation. Then call on Johnson Systems' ALARM for improved reliability, guaranteed.

Datapoint Chief Hits 'Intrigue' O'Kelley Charges Industry Shut Out of Rewrite

CW Washington Bureau
WASHINGTON, D.C. — "Confusing closed-door intrigue" is making it impossible for industry to participate in the attempt by Congress to rewrite the 1934 Communications Act, Datapoint Corp. President Harold O'Kelley charged here recently.

At a May 14 Capitol Hill press conference, O'Kelley called for additional public hearings on the bogged-down legislation to clarify the present status and direction of the rewrite effort in the Senate and House of Representatives.

"Because this legislation will have far-reaching impact, it is imperative that sufficient time and an adequate forum be provided for examination of the bill(s) by the American public and by the companies in the data processing, communications and related industries," he said.

O'Kelley called for "full public hearings" on H.R. 6121, now before the House Communications Subcommittee, and the corresponding bills in the Senate — S. 611 and S. 622.

Noting H.R. 6121 was produced by the subcommittee after public hearings on an earlier bill, H.R. 3333, the Datapoint executive said "it is essential . . . that the particulars of H.R. 6121 finally reported by the subcommittee . . . be explored and the impact of the bill analyzed."

Also, he said, "the many new issues which have been raised by recent amendments to the bill and the decision of the [Federal Communications Commission] in Computer Inquiry II

can be fully addressed during these hearings."

O'Kelley is concerned the legislation will "either unclearly or incorrectly" resolve many of the controversial issues of communications industry deregulation. "Moreover, many critical issues may be left unresolved."

'Ambiguous' on AT&T

H.R. 6121 is "ambiguous" in its proposal to allow AT&T to compete in unregulated data processing and communications markets through fully separate subsidiaries, O'Kelley charged. He specifically complained the bill "does not fully define the AT&T-subsidary relationship in such

critical areas as the transfer of technical and marketing information, the reciprocal use of product development and manufacturing resources and the proper allocation of costs related to products marketed by the subsidiary."

The chances for comprehensive and fair legislation must not be "stymied by an artificial squelching of issues and solutions," O'Kelley said, arguing that "only full congressional hearings — in both the Senate and House — [can] vent the continuation of a legislative process which increasingly has become a confusing closed-door intrigue." Interested parties should be given a reasonable period of time to study any proposed legislation.

Nixdorf Buys Software Firm

(Continued from Page 107)

parent company's plans to introduce an IBM plug-compatible mainframe (PCM) for the German market later this year. That system will reportedly be comparable to IBM's 4331, according to Klaus Luft, vice-chairman.

Despite Nixdorf's intention to introduce a mainframe, Luft said the firm intends to continue to concentrate on distributed data processing (DDP) systems. To date about 8,000 of Nixdorf's 8870 distributed system have been installed worldwide, Luft said.

TCSC's major products are Extended DOS (Edos), an enhanced, fully supported extension of IBM Release 26.2 DOS, and Edos/VS, an enhanced, fully supported virtual storage operating system based on IBM's Release 34 DOS/VS.

Wider Base

With products that compete head-on with IBM, Nixdorf now plans to widen TCSC's Edos base on IBM machines as well as expand the software for Nixdorf users, Luft continued.

Two years ago Nixdorf decided to avoid a hardware-only PCM strategy. While the firm currently has the ability to provide users a mainframe environment, until now it lacked software to go with the hardware, Luft noted.

Nearly 50% of Nixdorf's 1979 revenue of \$722 million was derived from mainframe users that employ Nixdorf's systems in a DDP network or as stand-alones in a DDP environment.

The U.S. subsidiary is the largest of the Nixdorf companies, with revenues of more than \$100 million last year.

Commenting on the acquisition, Nixdorf President Carl H. Janzen said TCSC would help "enhance both our parent company's software capability and the overall breadth of the U.S. subsidiary's product offerings."

TCSC, founded in 1973, now has annual revenues reportedly in the \$5 million range. It has 100 employees and claims to have 750 customers in 1,000 installations worldwide. In general its customers are IBM users with mainframes in the 370/135 to 158 range.

IBM'S ASCII: TRY IT FOR TIME-SHARING

The IBM 3101, an ASCII terminal, can access many time-sharing and remote computing systems or attach to most IBM or non-IBM computer systems.

It's priced as low as \$1,295 for character transmission models, and \$1,495 for block models. You

set it up yourself after delivery, which can be as soon as 45 days.

The 12-inch diagonal screen swivels and tilts. A detachable, contrast-enhancing filter reduces glare. The movable key-

board is like the IBM Selectric™.

A 15-day trial lets you see for yourself. Order the IBM 3101 by calling 800-431-2670. In New York, call 800-942-1918. Prices and delivery period subject to change.

IBM
Data Processing Division

CALL FOR 15-DAY TRIAL

Waiting On Delivery of A DEC LA120?

Avoid the hassle by upgrading your LA36 for 1200 baud operation with a DS120 Terminal Controller.

The Datasouth DS120 gives your DECwriter® II the high speed printing and versatile performance features of the DECwriter® III at only a fraction of the cost. The DS120 is a plug compatible replacement for your LA36 logic board which can be installed in minutes. Standard features include:

- 165 cps bidirectional printing
- Horizontal & Vertical Tabs
- Page Length Selection
- 110-4800 baud operation
- 1000 character print buffer
- X-on, X-off protocol
- Self Test
- RS232 interface
- 20 mA Current Loop interface
- Top of Form
- Adjustable Margins
- Double wide characters
- Parity selection
- Optional APL character set

Over 4000 DS120 units are now being used by customers ranging from the Fortune 500 to personal computing enthusiasts. In numerous installations, entire networks of terminals have been upgraded to take advantage of today's higher speed data communications services. LSI microprocessor electronics and strict quality control ensure dependable performance for years to come. When service is required, we will respond promptly and effectively. Best of all, we can deliver immediately through our nationwide network of distributors. Just give us a call for all the details.

Prime Information business systems. They'll grow as fast as your business.

There are plenty of small business systems on the market. But only Prime Information systems can grow from wherever you are to wherever you want to be.

Unlike other systems, all Prime Information systems hardware and software are totally compatible. So you can move from an I 500 to an I 1000 to an I 5000, and all your programs and data can move with you.

You should also know that Prime Information systems can be queried in simple everyday language. And because our network of authorized Prime dealers offers a wide range of application programs, you can get down to business right away.

For more information, contact your nearest dealer in the Yellow Pages, or call (617) 879-2960, ext. 4754. Otherwise, write The Advertising DL Dept., 3 Newton Executive Park, Newton, MA 02162.

PRIME Computer

Exxon Has Lots Up Sleeve

(Continued from Page 107)

profits from IBM, NCR Corp., Honeywell, Inc. and other prominent DP vendors than was predicted last year.

And many vendors have recently raised product prices, citing inflation as the reason.

How to Win Hearts?

Now that Exxon is No. 1 in *Fortune* magazine's tally of the top 500 U.S. companies, how can it win the hearts of DPsers among the other 499?

As pointed out last week [CW, May 19], the debut of Intecom, Inc.'s integration-oriented supercontroller may tip Exxon's hand somewhat. Exxon Enterprises, Inc., the corporation's holding company for venture capital operations, controls Intecom and 14 other DP-related vendors through its Exxon Information Systems (EIS) division.

This is the last half of a two-part series on Exxon's relation to the computer industry.

sion.

While Intecom prepares to deliver its Series 40 Integrated Business Exchange (IBX/540), an EIS affiliate located in Los Angeles is completing production of "a self-contained distributed processing system, realized in hardware and software" called the Delta 2.

In "Exxon Enterprises," a study now available from market research firm Yankee Group, Delphi Communications Corp.'s Delta 2 is termed "radically different from almost any other minicomputer-based system." The architecture has "no central processor, no main memory and no real 'on/off' or 'start' switch."

A dual-bus architecture ties together six different types of processors, each of which has exclusive access to a memory module and a section of the Delta 2 operating system, Yankee Group stated. This eliminates a need for main memory contention and keeps any failure of some Delta 2 processors from affecting the others.

According to Yankee Group, each processor can execute up to 7.5 million instructions per second (Mips). "A full-scale Delta configuration can support up to 32 processors, for total processing power of over 240 Mips," the market study maintained.

The Delta 2 could transmit data at 60M bit/sec if it were interfaced with a communications satellite, Yankee Group suggested. Depending on the configuration, a Delta 2 could support up to 4,000 terminals and/or up to 400 300M-byte disk drives and/or switching for up to 10,000 telephone lines and 300 trunks.

Exxon Enterprises may give Satellite Business Systems, Xerox Corp.'s Xerox Telecommunications Network and other communications services a run for their money if users start driving networks with the Delta 2, Yankee Group asserted. Delphi's system could also drive an Exxon value-added network in competition with GTE Telenet Communications Corp. and Tymnet, Inc., the research firm speculated.

Meanwhile, a replacement for the CRT may come from two EIS organizations in California's Silicon Valley: Kylex, Inc., which makes liquid crystal displays (LCD) in Mountain View, and

The Report

The study entitled "Exxon Enterprises" is part of the Yankee Group's Communications Information Systems Planning Service, which includes 12 reports along with a variety of seminars and other services.

The cost of the service is \$9,500.

The Yankee Group can be reached at P.O. Box 43, Harvard Sq., Cambridge, Mass. 02138.

Exxon Enterprises' Electrophoretic Image Displays (Epid) Division in Sunnyvale. Both LCD and electrophoretic technologies involve applying electric current to a liquid sandwiched between slabs of glass.

Such circuits display part of an alphanumeric character. They allow construction of video terminals that are far more compact than CRT units and consume less power while being less of a health hazard. However, LCD and electrophoretic technologies are presently far more costly than CRT technology.

Yankee Group suggested that those cost differentials will narrow rapidly as Kylex and Epid research continues under generous Exxon subsidies.

In Elmsford, N.Y., Optical Information Systems makes semiconductor laser devices. Exxon Enterprises could easily produce laser-driven, nonimpact printers based on that subsidiary's products, Yankee Group observed.

Lasers from Elmsford may support nonimpact printers similar to IBM's Model 6670 as well as communicating word processors, facsimile machines and microcomputers from Vydec, Inc., the Qwip Systems Division and Zilog, Inc., respectively — all components of EIS.

Already a leading vendor of microprocessors, Zilog might choose to tackle leaders in the desktop computer arena, Yankee Group noted, by engaging the newly formed Exxon Sales Corp. as a marketing arm. Exxon Sales currently markets products for Vydec, Qwip and Exxon Enterprises' Qyx Division, a maker of intelligent typewriters.

Exxon Enterprises also has affiliates working on voice response systems already interfaced to products from other EIS organizations, Yankee Group continued. A hush-hush "skunk group" named Xonex is designing workstation prototypes in Princeton, N.J., the firm added, and thin-film recording heads for computer mass storage devices are produced by Magnex Corp., an affiliate in San Jose, Calif.

Exxon Corp. is not the only petroleum supplier to have penetrated the computer industry. Sun Information Services Co., a Sun Oil Co. subsidiary, caters to the disaster recovery and security needs of DP users. Amoco Computer Services Co., owned by Standard Oil Co. of Indiana, sells systems to manage shipping and security for large manufacturers.

But the computer industry has never known such an entrant as Exxon, whose financial stature and diversity of technical resources must seem ominous to many veteran DP vendors as they cope with severely distressed economic conditions.

**86% of VAX performance,
\$83,000 less than VAX price.**

The Perkin-Elmer 3220.

A series of 58 benchmarks proves the Perkin-Elmer 3220 delivers 86% of the performance of a VAX 11/780.* For \$83,000 less.

Perkin-Elmer offers a powerful alternative to the VAX 11/780—the Model 3220.

The chart tells the story. In the 58 benchmarks, the VAX 11/780 configuration costing \$83,000 more outperformed the 3220 by only 14%. And there's more good news—you can get delivery on a 3220 in 60 days.

Of course, if you want a machine that outperforms the VAX 11/780 by a factor of 1.4 on these same customer-proven benchmarks, we've got the Perkin-Elmer Model 3240. And we'll save you money against the VAX price here, too.

The 3220 already has proven itself in a variety of demanding applications. In commercial, scientific, military/aerospace, and communications network installations, in seismic surveys and in off-track betting operations.

The 3220 gives you superior 32-bit

hardware and software performance. It gives you instantaneous terminal response for transaction processing, and very high throughput for real-time system control. And it delivers exceptionally fast and accurate results required for scientific programs.

The 3220 comes with a choice of special software packages: Reliance for transaction processing and AD-2000** for CAD/CAM. Perkin-Elmer's industry-leading globally optimizing FORTRAN VII is available for real-time, event-driven applications.

Program development is fast and easy. With our Multi-Terminal Monitor you can have 64 programmers working simultaneously with COBOL, FORTRAN, CAL MACRO, or RPG II.

System integrity is fully safeguarded from media faults and failures. Scientific accuracy is assured with single- and double-precision floating point processing. And dynamic memory relocation and protect hardware safeguard time-critical, memory-resident programs for real-time applications.

For complete information on how to save \$83,000 and get all the 32-bit power you need, call today or send in the coupon.

In a Dark Courtroom

U.S. vs. IBM Trial Marks Fifth Anniversary

By Connie Winkler
CW Staff

NEW YORK — The U.S. vs. IBM antitrust trial was five years old this month. But Courtroom 110 at Foley Square was dark on the May 19 anniversary, as it has been for two months.

The trial has proved to have a much longer life than anyone probably imagined when lawyers from the Justice Department and IBM's law firm of Cravath, Swaine & Moore walked into court May 19, 1975. At that time *Computerworld* reported predictions that the trial would be finished in a year, with time out for summer recess.

The then-head of the government trial team, Raymond M. Carlson pre-

dicted, at one of the pretrial meetings in early 1975 that the trial would take 60 days. There is disagreement today as to whether Carlson was referring to the entire trial or to the government's case.

Edelstein Optimistic

Judge David N. Edelstein was optimistic, too. *Time* magazine reported that in 1973 Edelstein said he would "prove the legal system is so advanced and so sophisticated that there is no case that's unmanageable."

The trial did not begin until six years and 122 days of meetings after the case was filed Jan. 17, 1969, the last working day of the Johnson Administration.

Today the trial has spanned 682 days of court and filled about 103,000 pages of transcript. No one person has been in the courtroom every day — not even Edelstein — because in the early part of the trial, witnesses' depositions were simply read to a court stenographer in an otherwise empty courtroom.

IBM has four economic experts yet to call on its witness list and it is uncertain when they will take the stand. Once IBM rests its defense, there will be the rebuttal case in which both sides will call witnesses to summarize their positions.

'No Excuse'

The government's head trial attorney Robert J. Staal chastised IBM for the delay in the economists' taking the stand. "There's no reason or excuse for the delay," Staal said last week, noting that it has been about 75 days since the last IBM witness appeared. "If the four economic witnesses had been presented live they would now be off the stand."

Instead the parties agreed that the

Comdex '80 Set For Las Vegas In November

FRAMINGHAM, Mass. — This year's Comdex conference and exposition, scheduled for Las Vegas on Nov. 19-21, is expected to be larger than last year's premier show.

Already, 170 companies have signed up for about 80% of the available exhibit space and Sheldon Adelson, president of the sponsoring Interface Group, expects an early sellout.

The Comdex '80 exhibit floor will be more than double the size of the Comdex '79 floor, he noted.

Comdex is geared to independent sales organizations and the manufacturers who sell all or part of their product lines through such independent and third-party channels.

Attendance last year was more than 4,000; this year a larger turnout is expected, according to Adelson.

The conference portion of the show will focus on general business and financial subjects of special interest to attendees, with emphasis on techniques for surviving high inflation and high interest rates.

The Interface Group is at 160 Speen St., Framingham, Mass. 01701.

Liability First, Relief Next, Trial Judge Decides

NEW YORK — Judge David N. Edelstein has ruled that there first be a decision on liability in the U.S. vs. IBM case before the court considers the question of relief, a ruling the Justice Department believes will speed the final outcome of the case.

"By postponing any litigation dealing with the details of a specific relief plan, it removes a phase from this principle case," the government's lead trial lawyer, Robert J. Staal, said.

In March Staal had asked Edelstein for the bifurcation — splitting — of the case so that there is a ruling on IBM's innocence or guilt before ruling on relief, or what's to be done if IBM is found to be a monopoly. The government has said it will ask for structural relief — a breakup of the giant computer manufacturer.

IBM, in chambers meetings with

the judge, had argued the relief issue should be considered along with liability. IBM counsel Thomas D. Barr said he feared IBM would be pelted with lawsuits during the interim of the liability ruling and the relief hearing.

In his May 5 memorandum, Edelstein said the relief hearing should be held only after the court rules on the issue of liability — and only if the government wins.

"To submit plans before such a decision would run the risk of substantial wasted effort" in the event IBM wins, if the government relief plans are not adequate or if the government relief plans are "rendered obsolete by changes in the market or within IBM during this court's deliberations on liability," Edelstein said.

IBM economists would present their direct testimony in writing, the first narrative to be delivered to the government by April 7.

The government is still waiting for the narratives.

IBM's head counsel Thomas D. Barr

said he did not wish to comment on Staal's statement, but called it "silly." He had previously noted that both parties and Edelstein are processing 5,000 to 6,000 IBM documents which IBM wants presented to the court before it proceeds.

You Ought To Be In Pictures.

Computer graphics sure beats searching stacks of printouts. You get the total picture, not just a bunch of numbers. Quickly. Accurately. Easily. Using ISSCO's DISPLA® graphics software, the typical plot requires less than 10 instructions. DISPLA works on most large scale computers and a selected number of superminis. It drives any plotting device that can draw a straight line to produce quality graphs and charts. Now for non-programmers there's TELL-A-GRAF® for virtual IBM and DEC systems. Plain English commands easily generate bar, column, line, surface and pie charts without the need for a programmer or artist.

Take advantage of these useful books to improve your executive, management and entrepreneurial skills. (Your money back if not satisfied!)

CD174 How to Develop an Effective Company Growth Plan,

by Wilbert E. Scheer.
This loose-leaf bound, 234-page manual includes practical, realistic counsel on developing both short and long-range growth plans for any size company. Scheer offers advice on launching new ventures, upgrading existing products, facilities and personnel, overcoming competitive pressures and developing a realistic, workable growth plan. Packed with charts, exhibits, checklists, tables, time-tested shortcuts, principles and guidelines. \$59.50

HM068 How to Evaluate People in Business,

by Dailey and Madson.
The effective evaluation of people in employment situations—including hiring, promoting or supervising—is one of the most serious problems managers face. This practical book argues that employees should be judged on the basis of a documented "track record" of results-producing performances, rather than on such criteria as good conduct, pleasing traits or political pull. \$12.95

HM067 Saving Money Through Ten-Year Trusts,

by William A. Hancock.
The only book of its kind to address the middle-income taxpayer, this guide illustrates how to save taxes and money through a short-term trust. The author defines a short-term trust, discusses how it operates, and offers guidelines to aid you in determining its appropriateness for your own situation. \$15.95

HM074 Calculator Analysis for Business and Finance,

by Texas Instruments Incorporated.
A powerful and time saving tool for everyone who needs to use calculations in professional or personal life. It offers step-by-step guidelines to the use of a programmable calculator like the TI "MBA" in solving any business or financial problem. Topics include forecasting, bond analysis, compound interest, personal finance, accounting, statistics, and more. \$16.95

CD179 Corporate Growth Through Internal Management Development,

by Wilbert Scheer.
An easy-to-follow loose-leaf manual for installing and conducting your own management and development program. Step-by-step details on attracting, retaining and developing the quantity and quality of managers you need. Shows you how to conduct human resources inventory, write managerial job descriptions, rate performance and appraise potential. \$59.50

CD172 How to Prepare an Effective Company Operations Manual,

by Seltz and Radlauer.
"Helps you save thousands of dollars, improve employee morale and increase efficiency." Concisely written, with a no-nonsense approach, this 210 page loose-leaf guide provides you with a rich reservoir of ideas and techniques to help you plan, prepare and implement a modern operations manual. Special attention is given to employee motivation to help you build a "success-oriented" company environment. \$59.50

CD171 How to Review and Evaluate Employee Performance.

Prepared by the staff of Universal Training Systems Company in loose-leaf format, this manual contains 18 case-study problems to help you diagnose and sharpen your knowledge of performance analysis and review, including charts and checklists to assist you in implementing a successful program. Focus is on appraisal techniques to motivate employees for maximum teamwork, productivity and profits. \$59.50

CD176 Word Processing,

by Walter Kleinschrod.
300 loose-leaf pages with everything you need to know to install a successful word-processing system in your organization. Exhibits, checklists, tables and charts help you through a six-point plan for determining the best, most profitable word processing system for your company's particular needs. \$59.50

CD180 How to Recruit, Select and Place Salesmen,

by Dr. Robert McMurry.
This loose-leaf guidebook contains a tested and proven method of finding those all-too-rare qualified salespeople. Called the "McMurry Step-By-Step Salesmen's Selection Program," it shows you how to uncover and assess a sales applicant's "can-do" and "will-do" qualities; conduct a patterned interview, use knockout questions to quickly screen out unqualified sales applicants; and choose the top producers by determining and assessing their emotional maturity. \$59.50

CD175 How to Boost Company Productivity and Profits,

by Raymond Dreyfack.
This 252-page loose-leaf manual helps you increase output and profits, and control your firm's rising costs in the critical years ahead by increasing productivity without increasing costs. Dreyfack explains how to improve your return on investment, build customer satisfaction and loyalty through improved quality. Text includes charts, diagrams and tables, plus a chapter on successful programs currently used by some of the country's top firms. \$59.50

CD177 Management by Objectives,

by Glenn Varney.
Also in loose-leaf format, this hand-book includes a complete, step-by-step approach to an MBO system. Shows you how to install the three critical factors of involvement, participation and autonomy; how to avoid eight deadly pitfalls; and how to use a three-step problem-solving technique to squash problems before they get a good start. Helps you to increase corporate flexibility to meet competition, enhance managers' effectiveness and improve employee commitment. \$59.50

CD181 How to Develop and Conduct Successful In-Company Training Programs,

by Universal Training Systems Company Staff.
Another in a series by UTC staff, this loose-leaf, 210-page guidebook helps you get outstanding results from your employee training programs. Written as a working tool, this guide deals with the practical application of good, sound training. It shows you how to plan the training, select the most appropriate training methods to fill your needs, develop training objectives, measure work performance and evaluate the effectiveness of the training program. \$59.50

Bad News and Good News Recession Here, But Not Too Bad, Industry Told

By Jeffrey Beeler

CW Staff
NEWPORT BEACH, Calif.
— Computer industry executives got some bad news and some good news here recently about the U.S.'s short-term economic outlook.

The bad news is that the country has finally slipped into the recession economists have long been forecasting in vain. The good news is that the downturn, though ex-

pected to be painful and unpleasant, will probably last only two to three quarters and will prove only moderately severe.

So said the U.S. Commerce Department's chief economist, Dr. Courtenay Slater. In a keynote address recently at Univac's third annual seminar on productivity, Slater allayed fears that this year's long-awaited recession might equal or even surpass in severity its

1974-1975 counterpart.

Most economic indicators suggest the current downturn will probably be about "average" for postwar U.S. recessions, Slater told an audience of press representatives and financial analysts.

Inflation and Productivity

Slater also offered some reasonably reassuring words about the nation's steadily worsening inflation, predicting that although it seems destined to continue for some time to come, inflation probably will not prove to be as severe during the coming months and years as it has been during the recent past.

Moreover, if the U.S. can somehow boost its productivity, the prospects for cutting inflation to less than 10% and keeping it there look reasonably promising, she added.

Unfortunately for the economy, efforts to combat declining productivity have fared rather poorly in recent years. Since 1973, the nation's average annual rate of productivity growth has slumped to slightly more than 1%, compared with more than 2% for 1967-1973 and more than 3% for 1950-1967.

Why has productivity growth dropped so precipitously? One possible explanation, Slater said, is that the causes of falling productivity have never been fully understood. In fact, about 60% of the U.S. post-1950 productivity decline remains unexplained.

Some observers have cited factors like decreased re-

search-and-development expenditures, rising energy costs and a weakening work ethic as possible reasons for the continuing productivity slump, but Slater rejected all such explanations.

She also left the clear impression that declining productivity might not be quite as much of a cause for alarm as many people have imagined. In part, Slater explained, the U.S. shrinking rate of productivity growth reflects a recent shift in its economic and social priorities.

Since the early 1960s, many of the resources the nation might otherwise have used to bolster its economic output have gone instead into efforts to strengthen environmental safeguards, increase worker safety and improve factory working conditions. The decision to pay increased attention to "quality-of-life" issues has inarguable social merit, but the benefits such a choice produces do not typically show up in conventional measures of productivity, Slater said.

HEX-29

The HEX-29 from DIGITAL MICROSYSTEMS is a low cost, high power data processor. Priced like a microcomputer, the HEX-29 is a multitasking, multiuser, time share computer.

The powerful bipolar bit-slice processor includes 16 or 32 bit integer and 64 bit floating point operations, multi-byte character string processing, translation table instructions and more. HEX-29 will accommodate bit, nibble, byte, word, double word, quad word and variable field operations.

The micro-programmed HEX-29 is a complete system with an expandable complement of powerful software tools.

The HEX-29 is a feature-packed minicomputer suited for business or scientific applications.

Contracts

Fifty Century Data Systems, Inc. Trident T-200 disk drive units have been ordered by Capital Business Management for its minicomputer-based systems. The Tridents — being interfaced with a Texas Instruments, Inc. TI 990 CPU and an electric printer — were designed for management and distribution, pharmacy and general business accounting applications.

Olde Worlde Products, Inc. has announced that it will be one of the first in the U.S. to install a System 80 Computer, the most recent edition to the Univac product line.

Beehive International, Inc. has signed an agreement with Prime Computer, Inc. to supply certain Beehive terminals designed to Prime's specifications through 1982. The value of the agreement will range from \$8 million to \$12 million through 1981.

The Data Defenders

It's too late for Ring King once it's ruined. Sure, the diskette itself can be replaced. But the data it stored was too important to lose.

Floppy disks are delicate. File them where they can flop around or stack them under pressure and valuable data is gone for good. A disk with even a minor flaw — like a dropout — has lost something you intended to keep.

Ring King systems are designed to provide the maximum protection for your full size or mini diskettes.

And Ring King systems are the last word in efficiency. No matter how great or small your storage needs, Ring King files are at your fingertips.

Without the best filing system you could be losing important information and valuable time. So don't just think about it. It's too late for Ring King once it's ruined.

For more information, contact your Ring King dealer. Or write for our brochure detailing the differences that make Ring King the safest, most efficient and economical storage system for your media.

Ring King Vastiles, Inc., 215 West Second Street, Muscatine, Iowa 52761, phone: 319/263-8144.

**Some of the
best minds in
the software
business will
be writing for
*Computerworld
Extra!***

**And the best
minds in the
DP business will
be reading it!**

***Computerworld Extra!* is a new concept for *Computerworld*, a new service for our 535,000 readers*, and a new vehicle for your advertising.**

Computerworld Extra! is an extra issue of *Computerworld* — our first ever — to be published this September 17th. It will appear in what our Editor, Drake Lundell, calls a "tabazine" format. This means glossy, full-color covers on the outside, and a magazine format inside — but tabloid-size throughout.

Computerworld Extra! will also be different in its focus. The entire issue will be devoted to one subject: "Software Systems in the '80s," and it will contain articles by some of the world's leading authorities on the subject, including Tom Mueier, Dixon Doll, Stephen Robinson, Dan McCracken and the experts at Auerbach Publishers and Datapro Research.

Topics to be covered will include The Bright Future of Applications Software Packages; the State of Utility Software, Data Communications Software Trends in the '80s and What's Ahead in Distributed Data Processing Software. Special emphasis will be given to one of the hottest areas of computer software — data base management systems.

COMPUTERWORLD

THE NEWSWEEKLY FOR THE COMPUTER COMMUNITY

A publication of CW Communications/Inc., the world's leading publisher of computer-related newspapers and magazines.

Sales Offices: Boston, 375 Cochituate Rd., Framingham, MA 01701, (617) 879-0700; New Jersey, Paramus Plaza I, 140 Route 17, North Paramus, NJ 07652, (201) 967-1350; Chicago, 230 North Michigan Ave., Chicago, IL 60601, (312) 782-7565; San Francisco, 353 Sacramento St., Suite 600, San Francisco, CA 94111, (415) 421-7330; Los Angeles, 3420 Ocean Park Blvd., Suite 3020, Santa Monica, CA 90405, (213) 450-7181.

Computerworld Extra! will be received and read by 105,000 paid *Computerworld* subscribers (ABC 12/31/79) and 430,000 pass-along readers (Becker Research Corporation). These readers include the Vice Presidents, Directors, DP Managers, and other MIS professionals who are responsible for the vast majority of all the data processing management information systems in America. They are the decision makers for well over \$2 billion in annual expenditures on software, and they rank *Computerworld* as the most useful publication they receive — by more than 3 to 1 (Becker Research Corporation).

We'd be glad to give you more information on advertising in this new publication from *Computerworld* — as well as complete details on our subscribers and readers. Just contact your local CW Sales office, or call Roy Einreinhofer, Vice President, Marketing, CW Communications/Inc. at (800) 343-6474.

DEC, Intel and Xerox Developing Low-Cost Net

LOS ANGELES — Three major computer vendors — Digital Equipment Corp., Intel Corp. and Xerox Corp. — are working jointly to develop electrical, logical and protocol specifications for a low-cost local area communications network for information processing.

Begun last spring, the network consists of a coaxial cable and communications transceivers designed to link different kinds of computers, peripherals and office equipment together in one building or a complex of closely grouped buildings. Each connected device will contain a control element allowing it to communicate on the cable through its transceiver. Specifications are expected to be published in the third quarter, according to Xerox.

Xerox is providing the basic local area network designs, represented in its Ethernet network capability; DEC is providing system design expertise in communications transceivers and microcomputer, minicomputer and mainframe computer networks; and Intel is providing expertise in the partitioning of complex communications functions into microcomputer systems and very large-scale integration.

In order to encourage communications compatibility over a broad range of equipment, the use of specifications by other corporations and organizations will be sought, Xerox said. Additionally,

the three vendors will cooperate with any standards organizations expressing interest in adopting the standards.

Although testing is incomplete, several specifications have already been established. Among them are a network operation capability of 10M bit/sec and a typical configuration that will consist of one or more segments of coaxial cable, each of which can be up to 500 meters long.

To promote widespread use of the new communications capability, Xerox, which holds patents on the basic Ethernet techniques, said it will make patent licenses available to interested parties.

MASS-11¹ FOR DEC² & RSTS/E³ For END USERS

MASS-11 Word and Data Processing software is now available for RSTS/E 6-C & 7 at one-half the cost of WORD-11¹. Supports various line printers letter quality printers and CRT type terminals. MASS-11 is also available for DEC and DEC compatible systems using RT-11⁴, RSX⁵ and TSX⁶ operating systems. Available on Tape, RL01, RK05 and RX01 distribution media. Honeywell Grant To Foster Study Of Technology

MINNEAPOLIS — Honeywell, Inc. is sponsoring a \$5 million grant to fund programs in computer sciences, microelectronics and other technologies at institutions of higher education that have close ties with major Honeywell operations.

The first award, a \$3 million grant that will be given out over a five-year period, has been awarded to the University of Minnesota to help support its Center for Microelectronics and Information Sciences, to endow a Honeywell chair in management information systems and to support the university's instructional and fellowship programs.

The center emphasizes advanced research in microelectronic design, distributed and parallel processing and automation and applications. It is also committed to expanding educational opportunities in high technology, according to Roger Staehle, dean of the university's Institute of Technology.

In awarding the grant, Honeywell Chairman and Chief Executive Officer Ed Spencer said, "As an advanced technology company, we share common teaching and research interests with higher education. As corporate citizens, we believe it is important to assist colleges and universities to develop graduates trained in the latest management and technical skills."

An initial \$2 million was contributed to the university center by Control Data Corp. recently. An additional \$6 million from other sources is expected to be given by the end of the year, according to Staehle.

A little DDP goes a long way.

Informatics' new General Ledger System offers the benefits of DDP to financial management at the minicomputer and mainframe levels.

On-line entry and inquiry, comprehensive security, reliability, and flexible reporting formats permit greater-than-ever control over your entire business operation.

Our fully integrated Accounts Payable System converses easily with General Ledger.

Now, DDP or stand-alone capability for minicomputer and mainframe business applications. From Informatics, "The Information Management Company."

POSITION ANNOUNCE- MENTS

Data Processing Professionals

Immediate Openings in Dallas, Houston & Lubbock

Immediate openings available in Dallas, Houston and Lubbock for both experienced and entry-level applicants. Entry-level positions require a major or minor in Computer Science. Positions require a 4-year college degree and permanent U.S. residency or U.S. citizenship.

General Business Applications Programmer/Analysts

Design, develop, and implement systems in support of worldwide general accounting, financial planning, cost accounting, personnel, facilities and marketing functions. Experience with IBM 370, minicomputers, IMS, COBOL, or DL/I applications preferred.

Manufacturing Systems Programmer/Analysts

Design, develop, implement and support shop tracking, production planning and quality tracking applications for worldwide manufacturing systems. Experience with IBM 370, minicomputers, COBOL, PASCAL, IMS or DL/I applications preferred.

Scientific Applications Programmers

Develop and support computer aided design and interactive graphics applications. Experience with IBM 370, minicomputers, COBOL, FORTRAN, PASCAL, data base management, numerical methods and structured programming preferred.

Data Base Analysts

Design, develop and support IMS data bases and support programmers with consultation, debugging and design assistance. 3-5 years' experience with DL/I applications programming and IMS data base design required.

Data Base Development

Design, implement and support new CODASYL data base management system for the TI-990 series minicomputer with emphasis on support in a distributed processing environment. 5-8 years' experience in data base systems implementation experience preferred.

MVS/JES 3 Operating Systems Internals

Modify and troubleshoot IBM operating system. 3-5 years' experience with IBM operating system and recent experience with MVS/JES 3 or TSO.

Office Automation Software Programmer/Analyst

Analyze, design and develop a word processing/data processing minicomputer system with an emphasis on evaluation and enhancement of performance. 3-5 years' experience in multi-tasking, disk-based operating systems using assembly language.

Computer Scientist — PhD — Dallas

Advanced strategic evolution of Data Processing Technology and Systems Architecture. Develop practical programs to implement emerging technology. Anticipate future trends and capitalize on them. High internal visibility position with worldwide scope and large impact. A PhD in Computer Science is required. Industry experience preferred.

If you wish to work in this highly motivating and challenging environment, send your resume in confidence to: John Hef/ P.O. Box 2103/Richardson, TX 75080. Or call collect (214) 995-3246.

TEXAS INSTRUMENTS

INCORPORATED

An equal opportunity employer M/F

Your Ideas Make The Pieces Fit!

National Semiconductor Corporation. Good ideas have made us what we are today. A Fortune 500 company and electronics industry leader. Here you can share your ideas with some of the brightest and most creative minds in the industry. We have the following opportunities where your ideas can make the pieces fit—for us and for you!

Programmer Analyst

You will program from specs in support of a worldwide purchasing and material system, as well as troubleshoot and develop tests for these systems. Requires at least 2 years of experience in a materials and purchasing function in an IBM environment with COBOL, OS and JCL. A working knowledge of TSO, Menext or Wybur, IDMS, CICS, IDS or IDS2 is preferred.

Sr. Project Leader

You will install and maintain our worldwide material and purchasing system. Responsibilities include generating program requirements and assuring compatibility with existing systems. Prefer 3 plus years of experience installing material systems, with 2 years of COBOL programming experience in an IBM environment. Project leadership experience and a knowledge of IBM OS/JCL is a must. Additional experience in TSO/SPF, Wybur or Menext is preferred.

Data Base Analyst

You will be involved with the design, development, and implementation of our Semiconductor Division Data Base. Requires a highly motivated MIS professional with 5 plus years of communications experience, including design, development, and project management. Must be familiar with COBOL, OS and JCL in an IBM environment, and preferably with IOMS, CICS Menext or Wybur.

National offers an excellent compensation package and rapid advancement potential along with the fabulous San Francisco Bay Area! For consideration, please send your resume to Lou Olsen at National Semiconductor, 2900 Semiconductor Drive, MS 16255, Santa Clara, CA 95051. An affirmative action employer.

National Semiconductor

Putting R All Together!

PROGRAMMER/ ANALYSTS Tulsa

Progressive transaction processing company currently has an opening for a Programmer/Analyst. Experience and/or knowledge of Fortran programming, program design, and system analysis. Opportunity to assume additional responsibilities. Salary commensurate with experience. Send resume to:

CISCO, Inc.
4135 S. 100th E. Ave.
Tulsa, Oklahoma 74145

"An Equal Opportunity Employer"

FACULTY POSITIONS COMPUTER SCIENCE UNIVERSITY OF MIAMI

Ph.D. required; responsibilities to include research, teaching, undergraduate and graduate program development. Specialties of interest include information systems design, data base, compiler theory, operating systems, software methodology and applications. Competitive salary. Send resumes to:

Oak Brook, Illinois 60521

The Designers of PANVALET®
An Equal Opportunity Employer

At Wang, we're always pushing the edge of technology. That's why we offer some of the most exciting opportunities in the business.

Right now, for example, we're working on our new VS 32-bit virtual storage com-

puter—a multi-function, multi-user system that outperforms the IBM 370/158. The VS can handle data processing, word processing, and database management, and can support 8 languages. The software challenge is to keep all

these functions working together efficiently.

We're looking for people who can tackle this type of problem—people who aren't afraid to break new ground.

So if you'd rather lead than follow, call Wang.

For more information, contact Lois Reibstein, Wang Laboratories, Inc., Dept. #C526. One Industrial Avenue, Lowell, MA 01851. (617) 459-5000.

Wang software developers don't follow the crowd. They lead it.

Making the world more productive.

© 1980 Wang Laboratories, Inc., Lowell, MA 01851. We are an affirmative action employer.

Systems Software Development.

SYSTEMS PROGRAMMING FOR OFFICE INFORMATION SYSTEMS

Development positions available at all levels of experience: entry level recent college graduates with BS or MS in Computer Science through individual contributors or project leaders with 10 or more years experience. Responsibilities include designing software and implementing systems programs for 8 and 16 bit microprocessors using assembly and block-structured languages (e.g., PASCAL).

PROJECT AREAS:

OPERATING SYSTEMS: supporting shared-logic clusters of application slave processors: terminals, printers, and other peripherals.

LOCAL NETWORKS: connecting shared-logic systems over very high speed data links supporting interactive access to programs, data files, and peripherals.

TELECOMMUNICATIONS NETWORKS: supporting public and host computer networks (e.g., X.25 and SNA) as well as gateways to Wang system networks.

SOFTWARE TOOLS: aiding the development of system and application programs in assembly and high level languages; including compilers, assemblers, linkers, text editors, and symbolic debugging aids.

PROTOTYPE HARDWARE SUPPORT: developing system and diagnostic software using new hardware as it is developed with hardware engineers from specification through final checkout.

BASIC LANGUAGE DEVELOPMENT

Join in the development and support of the interactive BASIC O.I.S. System. This distributed, microprocessor based system includes three major system programs: an Editor, Compiler, and Interpreter.

Language Development

Participate in the systems design of enhancements and major modifications to the BASIC system programs. Design and implement various programming modifications for the enhancement of the BASIC System including specification development, module design and coding, system and unit testing, and documentation.

Language Support

Support in-house and customer users of the BASIC language. Provide technical assistance to users and sales/marketing support. Isolate and remedy anomalies in the BASIC system. Design and implement enhancements to BASIC. Generate system releases, diagnostics, and demonstration programs.

Qualifications:

System level programming experience desired. BS/MS in Computer Science or related experience. Assembly language experience important.

WORLDWIDE MIS OPPORTUNITIES

We're a constantly growing force in the health care industry... a leader in product innovation... market penetration... productivity and profitability. We offer outstanding career potential to qualified professionals in the following positions available with our International Division.

Manager—MIS—Europe

We seek an individual with at least 10-12 years of comprehensive MIS experience, including staff/line systems management responsibility for multinational operations overseas. Background should include broad systems applications knowledge and experience; IBM, GSD and OPD equipment experience; long range systems planning experience; project management and consulting experience and familiarity with related technologies like telecommunications, word processing, etc. Education preferably would include a MBA or the equivalent.

The qualified candidate will provide guidance and assistance to European Affiliates on systems planning, project management, systems design, equipment and communications with the objective of providing an outstanding MIS function to support Affiliate business needs and meet headquarters requirements for information.

The position will be based in Chicago and travel will be approximately 35 to 45%.

Senior Systems Analyst

This position requires experience in all phases of development of computer based systems projects including systems design, feasibility studies, evaluation of software packages, training of users, testing, etc. At least 5-7 years experience involving business systems analysis, programming and implementation in a consulting or industrial environment is required. A BS in Business, Accounting, Marketing or a related discipline is preferred but not essential.

The Senior Systems Analyst will develop and implement systems for the International Division headquarters organization.

No travel is involved. The position is based in Chicago.

Systems Implementation Specialist

This position is ideal for an individual with a strong background in system design and implementation who seeks extensive international travel. The qualified candidate will have 4 to 6 years experience in implementation of manufacturing and distribution or financial systems (MRP/Cost, MAPICS, IPICS, MAC-PAC) and programming for IBM's small computer environment.

A working knowledge of RPG II is required and experience with System 34 is preferred. A Bachelor or Associate degree is preferred and fluency in Spanish or French is a definite plus.

The person in this position will work on a system team which is developing and implementing a standard MRP system in medium-sized Affiliate companies.

This position will be based in Chicago and travel will be approximately 40 to 50%.

In 1979, Abbott's worldwide sales exceeded \$1.6 billion and our outlook for the future is exceptional. We provide an excellent salary and benefits program that includes cash profit sharing, comprehensive insurance, relocation assistance and more. For consideration, send a resume in confidence to:

NORTH CHICAGO, ILL. 60064

Abbott is an Affirmative Action Employer

Insurance Systems

Dyer, Wells and Associates, specialists in system development and project management services, has clients in the major insurance and financial centers of the eastern United States and Canada. Several opportunities are currently available for individuals experienced in Group Insurance systems. These positions offer exceptional potential for technical, professional and financial growth. They also offer considerable challenge to self-motivated individuals who enjoy working with other talented persons in the creation of leading-edge system solutions.

Necessary Background

In addition to insurance systems experience a strong background in one or more of the following areas is necessary.

- Recent large system project leadership.
- Application of structured methodologies to large system developments.
- Cost/benefit analysis and feasibility study preparation.
- Large scale IBM based online system design and development.
- CICS and DL/I design and/or programming.
- Advanced business or technical degree is desired, but not required.

Available Positions

- Project/Team Leaders
- System Consultants
- System Designers/Architects
- System/Hardware/Analysts
- Programmer/Analysts

The Opportunity

Salary and other benefits are exceptionally attractive. All positions offer high visibility to top management levels of client companies and the opportunity for advancement within a small, rapidly growing professional organization. For more information please mail (confidential) resume, with salary history and statement of career objectives, to:

Programmer Analysts**Help create and extend a generation gap at NCR/San Diego.**

We're designing and developing a new generation of high performance mainframes. To surpass our previous achievements in virtual systems with multiprocessing capabilities is a major undertaking that requires a new OS architecture, a total software package from the ground up, and software talent of a high order.

You'll make major enhancements to our virtual operating systems — in ways that improve memories and facilitate disc emulation for PASCAL and COBOL languages, as well as migration path engineering. Or you'll help increase interactive speeds and multiprocessing capabilities. Or extend the state-of-the-art in distributed processing design. Or get involved in developing data base management systems. Or in developing new performance evaluation and modeling procedures.

If you welcome an opportunity to be on the forward edge of mainframe technology, investigate these openings at one of NCR's most prestigious and rapidly expanding Engineering & Manufacturing operations:

**Performance Assurance**

As part of our design team responsible for developing NCR's hardware and software architecture, you'll have considerable influence on distributive processing and sophisticated storage architecture. Extensive experience in computer performance evaluation and modeling is required.

Performance Analysts

Participate in design and evaluation of future NCR hardware and software products including an interactive processing facility for a large computer system. Requires knowledge of time-sharing system design, operating system architecture, systems organization, performance evaluation and modeling.

System Integration—Systems Management

You will be a member of our Systems Integration, Integration Test, or Configuration Management Team. You should have a BSCS, or equivalent, plus 2 years of work related experience.

OS Programmer/Analyst

Design and support future operating system software and new Recovery features in support of Transaction Processing/On-line systems. You should have a BSCS, or equivalent, plus 2 years of experience in large scale operating systems utilizing assembly language, or COBOL, PASCAL, or other block-structured languages.

Micro Program Designer

Requires GCR magnetic tape experience and micro program design background involving tape controller and drive. Engineering degree or equivalent GCR experience.

Firmware Programmer Analysts

You will participate in the design and implementation of firmware products on a micro-programmable processor for a distributed multi-processor system. BSCS required or equivalent plus microprogramming experience, knowledge of computer architecture, operating systems, language processors, I/O processing and storage hierarchy management.

Design Evaluation Engineer

Requires BSEE or BSCS or equivalent plus 5 years of experience evaluating and testing prototype and early production systems. Responsible for all phases of evaluation from initial test plan design to preparation of final status reports.

Software Quality Assurance Analyst

Assume project leadership responsibilities to include the testing and auditing of NCR's advanced operating systems software. BSCS/MIS or equivalent plus 5 years experience in applications programming, EDP auditing or systems software development.

On the personal side, you'll enjoy a competitive salary, top benefits, and relocation assistance to an area 22 miles north of downtown San Diego, in the heart of California living at its best.

Send confidential resume to: Mr. Tim McEwen, Manager, Professional Placement, Engineering and Manufacturing, Dept. 506, NCR Corporation, 16550 W. Bernardo Drive, San Diego, CA 92127.

Software Support Engineers Who Are Ready For Global Impact

Corporate Technical Software Support at Data General is an elite team of the best software troubleshooters available. Our goal? To build and operate the finest technical support operation in the minicomputer industry. Our team enjoys the visibility of a small organization, combined with the muscle of a Fortune 500 industrial leader.

Work with some of the most advanced software in the industry, troubleshooting and delivering technical support for complex operating systems and diagnostic systems.

You will need solid experience in assembly language and state-of-the-art software. Ideally, you will also have a broad background in software support with emphasis on complex software and hardware systems. Enjoy the advantages and opportunities of working at the corporate headquarters level in a position with more freedom and greater challenges than you believed possible.

Call or write in confidence, Ron Bloch (617)366-8911 ext. 3879, Data General Corporation, MS D-127, 4400 Computer Drive, Westboro, MA 01580.

Engineers

**Imagine
this!****Imagine
yourself!**

- a computer room one-quarter acre in size.
- a multi-billion byte data base.
- several hundred thousand lines of software to create and test.

- joining a group slated to double in the next sixty days, working on one of the world's largest management information systems.

CSC is developing a mammoth-scale, computer-based network for an international customer at our new facility in Herndon, Virginia.* Because this is to be a nation-wide computer network of profound proportions, every aspect of development is represented, down to construction of new facilities, and assuring that adequate communications exist. Software applications include a sweeping array of functional areas.

Intensive staffing search is now underway for individuals interested in a once-in-a-decade opportunity for growth and achievement. These are the work areas:

- Functional design
- Software development
- Test and evaluation
- Software architecture
- System performance trade-offs
- Communications system
- Database design and development
- Video systems design
- User terminal integration
- Command Center design and development

*** The Herndon work/lifestyle is better!**

Thirty-five miles west of Washington, just 5 miles from Dulles, you'll enjoy more home for your dollar, more land around your home, a fresher environment all around, and surely less energy expended for commuting.

OTHER OPPORTUNITIES AT CSC IN FALLS CHURCH

Openings now at all levels for C³ systems engineers, communication network architects, radio communication power systems design engineers, HVAC power and lighting, and systems and facilities engineers, and almost every engineering discipline you can think of that leads to the creation and implementation of large scale, turnkey communication systems.

For a prompt response regarding any of these opportunities, please rush your resume to the Director of Professional Staffing, MC/218-GG

New! 1980 Computer Salary Survey

**23 New Categories Reported!
Call for your FREE copy today.**

Unprecedented demand and inflation have combined to cause salaries in the computer field to rise sharply in 1980. The new Source EDP 1980 Computer Salary Survey and Career Planning Guide will let you know if your compensation is keeping pace with this growth...and the strategies you can use if it's not.

This comprehensive free report also provides you expert advice on a variety of important career topics such as:

- When you should consider a job change;
- How to make sure you are getting the proper exposure;

Expanded, All New Position Categories Surveyed

The 1980 Computer Salary Survey has been expanded to provide specific data for twenty-three new categories. These include positions in data communications, mini-micro programming, data base administration, technical marketing support and EDP auditing in addition to our traditional categories of programming, software, systems design, management and computer marketing.

- What steps you must take to break into management;
- How you can avoid career stagnation...and much more.

The 1980 Computer Salary Survey has been compiled by Source EDP, North America's largest recruiting firm devoted exclusively to the computer profession.

A REAL CHALLENGE FOR A RETIRED HIGH TECHNOLOGY EXECUTIVE.

The City of New Bedford, Massachusetts has an interesting and exciting position for a retired upper-level executive, formerly in the high technology industry. You'll assist the City's Industrial Development Commission in establishing good contacts in that industry. You will work according to your own schedule for the extent of the position, (3 to 6 months). And you should reside in the Greater Boston vicinity. If you'd like to help make great things happen for a growing, progressive city, reply by letter stating interest and qualifications (resume not required) to:

Richard C. McNeil, Director
New Bedford Industrial
Development Commission
1213 Purchase Street
New Bedford, MA 02740

Looking for a place of your own, on the leading edge of technology?

Join us at Hughes.

Come join our engineers working on advanced test systems for airborne and spaceborne radar avionics; tactical systems guided by lasers, TV, and infrared control; and computer-controlled trainers and simulators.

At Hughes Support Systems, our role is the design and development of these systems, as well as training of customer personnel, maintenance and operation worldwide. We need your know-how, and we'll reward you well if you can handle one of these responsible jobs:

• Design of automatic test systems • Digital hardware development • Electro-optical equipment design • Field system engineering • Maintainability analysis • Product support engineering • Real-time software • RF circuit design

Hughes offers you a home base in the easy-living climate of southern California, near LA International Airport and beach communities; excellent salary and benefits; and this unique brand of stability:

Our company has a backlog of over \$4½ billion in contracts comprising 1,500 different projects. When we complete one, there are a lot more challenges waiting, at Hughes.

Let's talk about what you and Hughes can do for each other. Call collect to (213) 641-6691, or send your resume to:

Hughes Aircraft Company Support Systems Department 050,
Professional Employment, P.O. Box 90515, Los Angeles, CA 90009.

ANALYST PROGRAMMERS

FIRST NATIONAL BANK is embarking upon a major data processing banking application. In doing so, we need to expand our staff in the Systems and Programming Department. Our management philosophy centers around our people; therefore, qualified people are needed in all areas of systems and programming.

We are currently looking for Senior Analyst Programmers and Analyst programmers. To qualify for these positions, you will need proficiency in COBOL and OS/JCL, with at least 3-4 years application programming and development experience. Your credentials should include:

- IBM OS
- ANS/COBOL
- IBM UTILITIES

Initially, you will be responsible for preparing file layouts, testing, programming, debugging, preparing programming documentation and procedures writing. You will be working with existing applications as well as new applications. For consideration, send resume with salary history to Penny Burton, Employment Manager.

Too Bad EVERYBODY Can't Work For Us.

But some just don't have what it takes. Like a total commitment to excellence in their work. And a positive, professional attitude. Not to mention a good, solid background in data processing. And boy do they miss out. No Allen Services top salary. No Allen Services extraordinary benefits. No way to experience the pride of working with a company like ours. We can't use everybody, but we can use the best. If that's you, call us. Find out why our employees have something to be thankful about.

DATA COMMUNICATIONS

A GREAT FUTURE IN THE STILL AFFORDABLE MIDWEST WITH UNINET INTEGRATED PACKET NETWORK

UNINET, a part of the UNITED INFORMATION SYSTEMS GROUP of UII, is an international data packet network serving the multiple data centers of United Computing Systems and On-Line Systems in over 200 cities in the U.S. and Europe.

We are currently expanding the scope and capabilities of UNINET and are seeking qualified individuals at our corporate headquarters in Kansas City, who desire an innovative environment with unusual growth potential.

SYSTEMS SOFTWARE DEVELOPMENT: Individuals knowledgeable in operating systems and real time environment will be developing network control software running under the MODCOMP, MAX IV, operating system.

COMMUNICATIONS SOFTWARE AND DEVELOPMENT: Qualified individuals will design, develop, and implement software for a network of mini-computer based systems of front ends, nodes and local concentrators. Entry level position requires 1-2 yrs. experience in Assembler language with a general understanding of real time programming. Senior position requires network experience with knowledge of BISYNC, 200UT, HASP, HDLC, SDLC, X.25 or other communications protocols.

UNINET offers you generous compensation and benefits including stock purchase plan, tuition reimbursement and pension program. Please send your resume with salary history to:

ADVANCED SOFTWARE / SYSTEMS DESIGNERS

- Advanced Software • Advanced Integration Engineering
- Interactive Systems • Operating Systems Internals
- Advanced Generator Systems • DB/DC Internals (IMS)
- Quality Assurance

An exciting professional challenge at General Electric Information Services Company—

one of the world's leaders in remote computing services

General Electric Information Services Company is looking for creative software designers who are interested in being part of a significant advanced system development team that is building a computing system for the 1980's and beyond.

We need you if you have experience and can help this team in the following areas:

ADVANCED SOFTWARE:

Software tools to aid in the development and integration of software products.
UNIX*/PWB Software Methodologies
PASCAL or LIS Top-down structured design

ADVANCED INTEGRATION

ENGINEERING:
Software installation, maintenance and testing.
MVS TPNS
SMP PTF Application

INTERACTIVE SYSTEMS:

Development of sophisticated interactive system structures in a multi-dimensional environment.
TOPS-10 TSO/PDS Internals
UNIX* WYLBUR

OPERATING SYSTEMS INTERNALS:

Creative development on IBM Operating Systems (MVS).
MVS Clusters Peripheral Processors
Multi-System SRM RACF/JES/TSO/SMF/Internals

ADVANCE GENERATOR SYSTEMS:

Program generation technology, application systems, end user languages, lexical-syntactical and semantic analysis.
COBOL PARSERS
IMS MACRO PROCESSORS

DATA BASE / DATA

COMMUNICATIONS INTERNALS:
Major enhancements to IMS/DB/DC and development of Data Dictionary/Directory software.
ACF/TCAM 2.2 Interface AOI/AOF
Multi-IMS Communication Remote Operability of IMS

QUALITY ASSURANCE:

Software Testing and deployment.
TPNS Verification/Validation
Testing Techniques S/W Reliability

Be a part of a team of top professionals who are breaking new ground both in the technical areas and the software development process. If you are interested in real design and development (not the same old maintenance and minor enhancement) then General Electric Information Services Company is interested in you.

CALL Pat Vaszko at (301) 340-5208

Or send your resume and salary history in confidence to: Pat Vaszko, Advanced System Design Program, Ref. 48D, ISW General Electric Information Services Company, 401 North Washington Street, Rockville, Maryland 20850.

FACULTY POSITIONS

Computer science, all ranks. Emphasis on teaching undergraduate curriculum in the following areas: Systems analysis, numerical methods, systems programming, microprogramming, non-numeric processing and programming languages. Ph.D. preferred. Master's degree candidates are invited to apply. Opportunity to pursue Ph.D. at nearby Clarkson College. Salary and rank depend upon qualifications. 2 positions open for September 1980. Send letter of application and resume as soon as possible to: Dr. Donald Burlingame, Dept. of Computer Science, Potsdam College of Arts & Sciences, Potsdam, New York 13676. An equal Opportunity/Affirmative Action Employer.

An important message for Computer Programmers and Systems/Software Specialists in the Boston, Dallas, Houston, Los Angeles and San Francisco areas:

Your present job could be costing you money—find out free

"If your salary is equal to or higher than the salaries you see on these pages, you may think you're well paid. Don't be misled. Your job may be costing you money. Find out how. Send for my free kit, *The Insider's Guide to Computer Compensation*."

Tom Ryan, President
Perry White & Associates, Inc.

Tom Ryan, President of Perry White & Associates, Inc. has helped thousands of data processing professionals find better paying jobs that offer greater earning potential.

In these times of economic uncertainty, it's more important than ever to make sure that you are getting the most out of your earnings potential. You should be aware of ways that your job could be costing you money. And you should also know about the opportunities available to improve your total compensation package. Here are just a few areas you should take a good hard look at before you conclude that you're being well paid in your present job.

Inflation—How do you keep ahead when inflation is running at the rate it is today? How much of a raise do you need just to keep even with inflation? How should you plan to cope with inflation in the future?

Taxes—How can you stay ahead of inflation when taxes eat up a large share of your salary increases? What happens when a raise puts you into a higher tax bracket?

Fringe Benefits—If you had to choose between more fringe benefits or a higher salary, which would you select? Do your current employee benefits—medical plans, dental programs, special bonuses and the like—adequately cushion your salary against inflation and the tax bite?

Other factors you should consider—Are you working—and living—in the part of the country you really prefer? Would you earn more elsewhere? What should you expect beyond just the salary you're being paid?

Tom Ryan's *Insider's Guide to Computer Compensation* will help you answer these and dozens of other questions that will help you determine whether you are being paid what you're really worth. It will show you how your present job may be costing you quite a bit of money—in ways you're probably not even aware of. *The*

Insider's Guide to Computer Compensation will aid you in evaluating your current earnings. And it will help you create a workable plan for the future, a plan which will show you how to keep pace with the rising cost of living.

Also in this kit, you'll find sections like, "Computer Industry Salary Comparisons," advice on when, and why a job change can work to your advantage—plus helpful hints about how to decide if a specific job is worthwhile. There's a proven way you can estimate the real value of compensation offered by an employer—as well as a guide to selecting the best paying employment opportunity—plus many other frequently overlooked factors to consider in order to get what you deserve for your valuable professional skills.

Free—The Insider's Guide to Computer Compensation.

Call now 800-447-6700 toll-free, and ask for *The Insider's Guide to Computer Compensation*—we'll send it to you with no obligation of any kind, and at no charge whatsoever. This 12-page, step-by-step guide includes a special section to help you evaluate your present compensation, and plan for your future.

Your job may be costing you money. Find out now what compensation you should be receiving for your computer skills. Call today for your free guide, or mail the coupon below.

PROMOTE YOURSELF

DATA BASE DESIGNERS/ENGINEERS

Needless to say, DBMS has come of age; and our Houston clients are no exception. We are currently recruiting DATA BASE PROS for six Fortune 500 clients. These positions are located in Downtown, Greenway Plaza, Northwest Houston, and Intercontinental Airport area. They range from DBA to Analyst. Experience in ADABAS, IDMS, IMS, and IDS is equally acceptable. Hardware is not important. Degrees are preferred but not necessary. Experience is what counts here.

To \$45,000

ADDINGTON & ASSOCIATES
PERSONNEL SERVICES, INC.
3013 FOUNTAINVIEW SUITE 200
HOUSTON, TEXAS 77057
(713) 780-8810

University of Connecticut, Computer Systems & Data Processing User Services Manager — University Computer Center. Responsible for the planning, organization and direction of the User Services Group. The Group's responsibilities include: provision of information, user education and advice, and the support and maintenance of language processes and applications software. Applicants should have a thorough knowledge of computers and their applications and have considerable experience of academic computer services. A master's or higher degree from an accredited University is highly desirable. Salary negotiable.

Systems Programmer/Analyst—University Computer Center (3 positions) To participate in various levels of analysis, implementation, and user support of systems and applications software. Prior systems programming experience with OS/VS, JES2 or VM370; experience in provision of advice, documentation and education to computer users in an academic environment; and/or experience and interest in test/word processing would be considered an advantage. A four year degree in Computer Science or a related area; or, in lieu of degree, several years relevant work experience is required. Salary \$18,000 — \$28,000.

Systems Analyst/Programmer—Student Data Systems to provide systems analysis, development, and programming of administrative computer-based, student related systems. To maintain current systems, develop new computer-based systems and provide technical support for user departments. Applicants should have a Bachelor's Degree, 3 years of systems development and programming experience. A working knowledge of COBOL, DOS, operating systems, and Data Base Management experience would be highly desirable. Salary \$16,000 — \$21,000. Excellent benefits package together with a comfortable work environment in a pleasant rural atmosphere.

Please send resume and a letter of application by 5:00 PM, with which meeting you are interested in, to: Robert E. Nease, Chief, Computer Systems and Data Processing, University of Connecticut, Storrs, CT 06269.

PROGRAMMER/ SYSTEMS ANALYST

Natl Trade Assn. in Washington, D.C. needs individual with 1-2 yrs. RPG II exp. on IBM Sys/3. Knowledge of CCP and OCL a plus. Salary open.

Call 202-342-8235

SYSTEMS ANALYSTS

Supervisory & Non-Supervisory Positions

Consumers Power Company is seeking Systems Analysts to assist in the development of new computer systems for a variety of application areas within our General Services Department.

Responsibilities will include review of existing manual systems, development of economic cost/benefit analysis, preparation of detail system design logic and coordination of the programming, system test and system implementation phases.

A supervisory position is also available for an individual to manage the development of computerized General Services Systems. This position would require a great deal of contact with major department heads and critical decision making.

Requirements

- BS Degree in Computer Science or Math
- At least 3 years' programming/analysis experience
- Experience in computer project development and management
- Beneficial to have experience with computerized Materials Management Systems to help support the Company's recently installed Materials Management Systems

Consumers Power Company is a major investor-owned gas and electric utility operating in the lower peninsula of Michigan. These positions are located at the Company's General Office in Jackson, Michigan.

If you are interested in these opportunities for growth and a challenging work environment, please send your resume, including salary history, in confidence to:

Your Ultimate Choice

Recession? You don't live in Houston!

We can't keep up with the jobs phoned to us for data processing personnel. On any given day, we have 200 to 400 positions open for programmers, analysts, systems programmers, data base analysts and operations personnel. The energy based Houston economy is the strongest in the country, and most of our jobs are with major oil companies or related industries. Consider the following facts about working in Houston:

- Texas has no state income tax (results in 6% to 10% raise for most of you).
- All the companies we work with offer complete interview and relocation cost coverage.
- Many companies are willing to buy your present house or help you sell it.
- Houston has lower housing costs than Atlanta, Chicago, Cincinnati, Cleveland, Dallas, Detroit, Kansas City, Los Angeles, Miami, New York City, Pittsburgh, St. Louis, San Francisco or probably any other major city you could interview in.
- Contrary to prior belief, traffic is not that bad (many of our staff have a five to twenty minutes drive to work).
- Galveston Island (golf, fishing, sailing) is only one hour away.

Below are a few of the positions currently open with our largest clients, one of the world's principal producers of crude oil:

SYSTEMS ANALYSTS	Salary range \$22,000-\$35,000
MVS SYSTEMS PROGRAMMERS	Salary range \$24,000-\$30,000
DATA BASE ANALYSTS	Salary range \$22,000-\$32,000

If you are interested in these positions, or just want to talk about the Houston job market, call Cliff Reilly or Roger Hall collect at (713) 621-9050. Our receptionist will take your name and number and we will call you back at your expense.

DEVELOPMENT ENGINEERS □ PROGRAMMERS/SYSTEMS ANALYSTS

NCR's financial terminals can do as much for your career as they do for financial institutions.

No other company is as solidly in the vanguard of financial terminals development as NCR. We've revolutionized the banking business, and we mean to dominate this continually expanding field. If you're a person who can make significant contributions to new generations of intelligent terminals, modular terminal-networks and firmware/software systems . . . get in touch with us—fast.

As a Development Engineer you'll be making rapid strides in advanced microprocessor applications, distributed data processing, network and data communications. As a Programmer/Systems Analyst you'll have total systems involvement and will see your contributions as an integral part of a working, state-of-the-art system. Show managerial ability, and management responsibilities will come rapidly. Terminals make the system. At NCR/Dayton they also make careers.

We have immediate openings for professionals with experience in these areas:

**DEVELOPMENT
ENGINEERS**

- Microprocessor Applications
- Digital and Analog Circuits
- Electrical Control Circuitry
- Terminal Peripherals

Familiarity with microprocessor programming helpful for all positions.

**PROGRAMMERS/
ANALYSTS**

- Microcomputers
- Minicomputers
- Distributed Processing Systems
- Communications Software

Requires background in Assembly language.

We offer an outstanding compensation and benefits package, wide open career paths, and a location that offers friendly, lower-cost midwestern living at its very best.

DIRECTOR

Administrative Computer Center University of Maryland College Park

The University of Maryland, College Park Campus, seeks an experienced and highly qualified individual as Director of the Administrative Computer Center.

This Associate Staff position reports directly to the Vice Chancellor for Administrative Affairs at the College Park Campus and is responsible for a staff in excess of 60 full time and 10 part time people. The Center has a large UNIVAC 1108 system and an H.P. 300 (2 meg.). Additional H.P. 3000's are being installed as part of a multiple-campus plan for implementation of an Administrative Computing Network.

The Center supports all the administrative computing needs of the College Park Campus, including student records, student billing, financial systems, and a large library system. The Center Director is instrumental in the process of shaping the Administrative Network and interacts closely with other University campuses concerning network service and standards.

Candidates should have a minimum of a Bachelor's Degree, although an advanced degree is preferred. At least 6 years of significant management experience in the computing area in an institution of higher education is required. The candidate should have demonstrated ability in budgeting, planning, and a broad range of technical matters in a comparable computer facility. The position is immediately available.

Salary based on qualifications, minimum of \$40,000.

Send application/nomination, resume and three professional references with postmark not later than June 6, 1980 to:

Dr. Gene T. Sherran, Chairman
Search Committee for Director of
Administrative Computer Center
University of Maryland
Room 1108, Main Administration Bldg.
College Park, Maryland 20742

The University of Maryland actively subscribes to a policy of equal employment opportunity and will not discriminate against any employee or applicant because of race, age, sex, color, religion or political affiliation.

NORTHWEST ALASKAN PIPELINE COMPANY

AUTOMATED PRODUCTION CONTROL OR SCHEDULING SYSTEMS SALES REPS. (THREE NEEDED)

If You Have A Successful Track Record Selling Automated Production Control or Scheduling Systems, You Want to Work With Us.

Due to the success of APEX — our automated production control system (see the Johnson Systems' ad on page 73) we need three sales people. Two of the people we hire will work out of our McLean, Virginia office . . . just outside Washington, D.C. The other representative will be based out of our Dallas, Texas, office.

Johnson Systems is the #1 vendor of computer job accounting packages in the world. This is your chance to join a rapidly growing company with excellent working conditions and a superior compensation package.

Call Tony Thompson immediately at 703 821-1700. We want you on board before July 1, 1980.

Johnson Systems, Inc.
7923 Jones Branch Drive
McLean, Virginia 22102
Telex: 89-9100 • Phone: 703 821-1700

Johnson Systems, Inc. is a major independent supplier of performance-related data center management software. Offices are located near Washington, DC and in Dallas, London, and Düsseldorf with representatives around the world. JSI's first package, the JOB ACCOUNTING REPORT SYSTEM (JARS) has been installed at over 2,000 sites world wide, making it the most widely used package of its kind. Corporate headquarters are in suburban McLean, Virginia, just 10 miles from the monuments and excitement of our nation's capital, one of the world's leading centers for the development of software products and services.

TECHNICAL SUPPORT MANAGER

Growth Means Many Things at
FISHER-PRICE.

For almost half a century, America's children have been growing and learning with FISHER-PRICE toys. This has contributed to an annual growth rate of 25% in recent years which, in turn, has helped keep careers at FISHER-PRICE moving.

Yet, out of all this growth rises a need for a skilled Technical Support Manager at FISHER-PRICE, a division of the Quaker Oats Company.

The long range goals and plans of software will be your responsibility as will be the technical support report budget and assistance in hardware and software evaluation and purchase. In addition, you will direct your subordinates in the areas of data base management, operating systems, communications, software and application support and also be involved with vendor related support.

Your bachelor's degree in computer science (or business management degree emphasizing computer science) and at least two years of management experience with, preferably, a working knowledge of Univac hardware and software and good communications skills are needed here.

There's an excellent salary waiting for you at FISHER-PRICE with a valuable benefits package that includes profit-sharing, stock purchase and pension plans, group medical, dental and life insurance, long-term disability education assistance and a relocation provision. There is also a solid opportunity to keep your career growing with a growing company.

FISHER-PRICE in East Aurora.

Please feel free to send your confidential resume to:

AMCA International

SUN BELT OPENINGS

AMCA International is perhaps the most dynamic company going today, and even more so — tomorrow. AMCA's world wide operations consist of 32 different companies and 48 manufacturing facilities. Sales during 1979 were approximately one billion dollars. Profits have maintained a 29% compounded annual growth rate in earnings per share. Our products include everything from chain-saws to cranes — from metal buildings to petroleum refineries. Our operating philosophy is to diversify strategically — no single industry, no single national dependence — and yet maintain the continuity of sustained, orderly growth. We offer a benefit package comparable to any in the area. We offer competitive salaries, challenge and potential, and an exciting environment — both today and tomorrow.

AMCA's Memphis, Tennessee Computer Center has two IBM 370/158's. Our Operating System is MVS and we offer CICS, CICS/PANVALET, DL/1, TSO, and SPF to support our COBOL development efforts. Currently openings exist for:

PROGRAMMER/ANALYSTS

If you desire a more dynamic, challenging and exciting future and have a minimum of two years, COBOL EXPERIENCE, please send resume or call 1-901-372-6464.

SENIOR PROGRAMMER/ ANALYST

The Andersons, a Midwest Agribusiness, with sales in excess of \$700 million has a challenging career opportunity available in its Information Services Division. This position is accountable for developing on-line systems within our operational areas. The incumbent must be able to effectively design, code and implement computer programs, insuring a successful completion of all projects by planning, cost control and performance measurements.

Successful applicant must have a minimum of 3 years in COBOL or Basic Interactive Programming and a degree in a related area. Honeywell 2000, H-P 3000-III or Micro-data experience is a plus.

We offer an excellent company paid compensation program including a liberal profit sharing plan. Qualified individuals should direct resume and salary history to:

SALE OF COMPUTER EQUIPMENT

NOTICE IS HEREBY GIVEN that sealed bids will be received at the office of Gary Nichols, Deputy Clerk, Business Office, Mt. Hood Community College, 28000 S.E. Stark Street, Gresham, Oregon, for the sale of the following computer equipment:

- GROUP 1: -IBM Model 360/30 84K Microsecond Cycle Time
-IBM Model 1052 Console
-Software
- GROUP 2: -IBM Model 2540 Card Reader/Punch Unit
-IBM Model 2401 (1) and 2403 (2) Magnetic Tape Drives
-Additional Hardware
- GROUP 3: -IBM Model 1403 Line Printer
- GROUP 4: -Model 2311 Disk Storage Drive
-Disk Packs

The computer equipment to be sold will be available for viewing June 2, 1980 and June 3, 1980, with prior arrangements being made by contacting Mike Stevenson, (503) 887-7298, or Judy Knecht, (503) 887-7442. For complete list of the computer equipment contact the Purchasing Department, (503) 887-7274.

Please present bids in a sealed envelope to the College Business Office by or before 3:00 PM, 1980, June 3, 1980, at which time the bids will be opened and read.

Please identify all sealed bids submitted by indicating "SEALED BID - COMPUTER EQUIPMENT" on outside of envelope.

The Board of Education or other authorized representatives of Mt. Hood Community College District reserve to themselves the right to reject all bids and to waive any and all irregularities as they may deem best for the interest of Mt. Hood Community College.

Gary Nichols, Deputy Clerk/
Assistant Business Manager

CLASSIFIED ADVERTISING ORDER FORM

Computerworld's Classifieds work.

Issue Date: Ad closing is every Friday, 10 days prior to issue date.

Sections: Please be sure to specify the section you want: Time and Services, Software for Sale, Position Announcements and Buy/Sell/Swap. (Available upon request: Software Wanted, Turnkey Systems and Real Estate.)

Copy: We'll typeset your ad at no extra charge. Please attach CLEAN typewritten copy. Figure about 25 words to a column inch, not including headlines.

Cost: Our rates are \$73.50 per column inch. (A column is 2" wide.) Minimum size is two column inches (2" wide by 2" deep) and costs \$147.00 per insertion. Extra space is available in half-inch increments and costs \$36.75. Box numbers are \$10.00 extra.

Billing: If you're a first-time advertiser, (or if you have not established an account with us), WE MUST HAVE YOUR PAYMENT IN ADVANCE.

Ad size desired: _____ columns wide by _____ inches deep.

Issue Date(s): _____

Section: _____

Signature: _____

Name: _____

Company: _____ Title: _____

Address: _____

Telephone: _____

RSX-11M USERS

Do you need increased throughput?
The standard RSX-11M disk driver does not take full advantage of hardware overlap capabilities. All thirty installations of CYTROL's Overlap seek Disk Driver (OSDD) have benefitted from system throughput improvements!

OSDD features include:

- overlapping of seek operations with data transfer
- support for RK, RM, RP and all compatible drives
- dual porting support
- all standard driver functions
- compatible with all versions of RSX-11M
- simple installation - no SYSGEN

CYTROL

4570 West 77th Street
Edina, Minnesota 55435

NEW LIFE FOR 1401 PROGRAMS

CS-TRAN converts your 1401 object programs to COBOL for the mainframe or mini of your choice.

CS-TRAN is the only translator that accepts your object programs, patches and all, yet allows you to include actual COBOL paragraph names and record definitions.

If you'd like more details about new life for your 1401 programs just call or write Russ Sandberg.

C-S Computer Systems Inc.

THE TIME SAVERS

RPG to COBOL
or for those PL/1 Shops
RPG to PL/1

Two of the many successful translators offered by Dataware provide a smooth and effortless transition from RPG. The translators can handle most any level of RPG (SYS/3, Mod 20, etc.) and achieve an extremely high percentage of automatic conversion (approaching 100%) of the source code.

For more information please call or write today!

You can buy financial software that's full of nasty surprises...

At McCormack & Dodge, we don't believe in surprises. When you get a general ledger, accounts payable, fixed assets, capital project accounting, purchasing or other software package from us, you know exactly what's in it. And what isn't. Right up front. ☐ You'll never have to worry about "phantom" programs that are supposed to be there but aren't. You won't suddenly find yourself with dozens and dozens of programs to load and unload. Or programs that take all day to run. You won't discover you can't generate the reports you need. Or that there's no way to prevent obsolescence. ☐ Instead you'll get a streamlined, easy-to-use system. A minimum number of programs.

Fast, flexible, meaningful reporting. First class service and support. Our continual enhancement plan. And no surprises. ☐ Our software packages are designed by a team of both financial and data processing experts. They've been audited by the "big eight" accounting firms. Given top ratings in the 1978 Datapro Users' Survey. Selected by some of the world's most critical financial executives. And installed in over 800 companies, including dozens of the Fortune 500. ☐ Now it should come as no surprise to you that 7 out of 10 companies we talk to end up doing business with us instead of somebody else. Shouldn't you talk to us too?

or you can talk to McCormack & Dodge.

Talk to us:
